AGÊNCIA NACIONAL DE AVIAÇÃO CIVIL
Rua Renascença, nº 112 - Ed. Office Congonhas - Vila Congonhas, São Paulo/SP, CEP 04612-010
https://www.anac.gov.br

Ofício nº 1720/2023/GCTA/SPO-ANAC

Ao Senhor
GERALDO COSTA DE MENESES
Diretor de Operações da empresa TAM Linhas Aéreas S/A
Rua General Pantaleão Teles, 210 - Parque Jabaquara
CEP 04355-901 - São Paulo - SP

Assunto: **Recebimento de manual**
Referência**: Processo 00066.016369/2022-93**

Prezado Senhor,

1. Este ofício atesta o recebimento do seguinte manual:

Nome da empresa	Nome do manual	Revisão	Data
TAM Linhas Aéreas S/A	AOM - Aircraft Operating Manual - A32F, SEI 8727190; Documentos associados: FCOM A319/A320/A321 02/05/2023, SEI 8727187; QRH A319/A320/A321 02/05/2023, SEI 8727184; FCTM A318/A319/A320/A321 16/11/2022, SEI 8727181. AFM A320FAM 03/05/2023 SEI 8727189	02.05	02/05/2023

2. De acordo com a Instrução Suplementar nº 121-010, operadores certificados podem revisar, distribuir e usar material aceito mesmo que a ANAC ainda não tenha realizado uma avaliação. Entretanto, se depois de uma avaliação a ANAC determinar que partes do material são inaceitáveis, o operador deve revisar tais partes inaceitáveis nos prazos e condições estabelecidas.

3. O presente documento não concede isenção a nenhum item de regulamento ou norma vigente. Adicionalmente, destaca-se que é responsabilidade do operador assegurar que o conteúdo do manual contemple todos os requisitos aplicáveis e, concomitantemente, não esteja em conflito com nenhuma norma vigente.

4. Ainda, é responsabilidade do operador garantir o cumprimento dos procedimentos e políticas definidas no manual. O não cumprimento do conteúdo do manual poderá representar deficiências na certificação do operador, bem como motivar a adoção das providências administrativas cabíveis.

5. Esta gerência permanece à disposição para os esclarecimentos necessários.

Atenciosamente,

Leonardo Gonçalves Coutinho

Gerente Técnico de Certificação

Documento assinado eletronicamente por **Leonardo Gonçalves Coutinho**, **Gerente Técnico**, em 12/07/2023, às 17:59, conforme horário oficial de Brasília, com fundamento no art. 4º, do Decreto nº 10.543, de 13 de novembro de 2020.

A autenticidade deste documento pode ser conferida no site https://sei.anac.gov.br/sei/autenticidade, informando o código verificador **8841473** e o código CRC **02C615D2**.

PRELIMINARY PAGES

AIRCRAFT ALLOCATION TABLE

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

IF INSTALLED TABLE

Ident.: GEN-IFIT-00016590.0001001 / 23 JUN 15

Applicable to: ALL

The "If Installed Table" provides a list of optional systems and functions of the aircraft. For most of the optional systems or functions associated with the "if installed" ◁ symbol in the FCOM, the table indicates if the optional systems or functions are installed, or not installed.

Note: *Highly customized options such as cabin installations are not covered in the following table.*

MAIN FCOM CHANGES

Ident.: GEN-00012867.0001001 / 03 AUG 17
Applicable to: ALL

The purpose of the Main FCOM Changes is to provide operators with general information about the most significant changes that are introduced in the current revision of the manual.
The main FCOM changes are available on the Airbus World portal, under the path: Content Library / Flight Operations / Manuals / Main FCOM - FCTM - MMEL Changes.

In addition, every revised Documentary Unit (DU) has a revision highlight (HL) that:
- Indicates the change(s) made to the DU
- Can be found in the associated “Preliminary Pages – Summary of Highlights” subchapter.

In addition to the Main FCOM Changes, the Modification Operational Impact (MOI) documents available on the Airbus World portal provide the operational impact linked to a MOD number.

FCOM PURPOSE

Ident.: GEN-00012627.0001001 / 22 NOV 21
Applicable to: ALL

FCOM PURPOSE

The Flight Crew Operating Manual is a support document for flight crew.

The purpose of the FCOM is to:
- Provide all necessary operating limitations, procedures, performance and system information the flight crew needs to safely and efficiently operate A320 family aircraft during normal, abnormal, and emergency situations
- Serve directly as Flight Crew Operating Manual, or as a basis for Operators to develop their own customized Airline Operations Manual, in accordance with applicable requirements
- Serve as a comprehensive reference guide during initial and refresher flight crew training.

Note: *This manual is not designed:*

- *To teach basic piloting skills*
- *To provide basic piloting techniques applicable to jet aircraft, or information, that are considered as basic airmanship for trained flight crews who are familiar with that type of aircraft and its general handling characteristics.*

The FCOM complements the Airplane Flight Manual.
If the FCOM data differs from the AFM data, the AFM remains the reference.
As a supplement to the FCOM, the FCTM may provide additional information that the flight crew should read in conjunction with the FCOM. For more information, *Refer to FCTM/GI FCTM Purpose*.

For any questions or comments related to this manual, the Operator's Flight Operations Management can contact the Airbus Flight Operations Support & Training Standards department.

FCOM CONTENTS

The FCOM has four sections:

- Aircraft Systems : This section is divided into ATA chapters for each aircraft system. This section includes a specific description of each system and its associated cockpit interfaces.
  When several layouts are possible for the same cockpit interface (e.g. when the position of the ON/OFF label of a switch changes depending on the aircraft configuration), the FCOM may describe only one typical layout.
- Procedures : This section contains the following chapters:
  - Abnormal and Emergency Procedures
  - Normal Procedures that include the SOP, the SUP, and the SRP
  - Special Operations.
- Limitations : This section provides the aircraft and system limitations that the flight crew must know or refer to in operations.
- Performance : This section includes the performance computation description for each flight phase.

DOCUMENTARY UNITS

The FCOM is made of Documentary Units. The DU is the smallest part of information with a technical content.
The DUs are listed on a separate "List of Effective Documentary Units" (LEDU). *Refer to the General section*.

Note: *1. DUs can be grouped into Group of DU (GDU)*
2. Temporary information may be provided via Temporary DU (TDU).

IDENTIFICATION STRIP

Below the title of the DU, the identification strip provides:
- The list of MSN the DU is applicable to
- For TDU, the reference to the DU impacted by the TDU.

LIST OF EFFECTIVE SECTIONS/SUBSECTIONS (LESS) - PAPER ONLY

Ident.: GEN-00013786.0001001 / 23 JUN 15
Applicable to: ALL

The List of Effective Sections/Subsections (LESS) summarizes all the sections and subsections contained in the FCOM. For each revision, a new LESS is issued when at least one DU of the section/subsection is changed.

The LESS consists of:

- The "M" field that may provide the following evolution code:
  - The "N" letter indicates a new section introduced by the revision
  - The "R" letter indicates a section in which the content has been revised
  - The "E" letter indicates an aircraft validity change within the section
  - The "M” letter indicates a section that have move within the FCOM
- The “Localization” field that allows localizing the section within the manual with the product structure
- The “Subsection title” field
- The “Rev. Date” field that indicated the date at which the section was changed.

LIST OF EFFECTIVE DOCUMENTARY UNITS (LEDU) - PAPER ONLY

Ident.: GEN-00013789.0001001 / 23 MAR 11
Applicable to: ALL

For each revision, a new List of Effective Documentary Units (LEDU) is issued at the section level. The LEDU provides information about the DU localization, applicability, identification and issue date.

The LEDU consists of:

- The "M" field that may provide the following Evolution Code:
  - The "N" letter indicates a new DU introduced by the revision
  - The "R" letter indicates a revised DU: The content of the DU is updated by the revision. A vertical line in the margin of the DU locates the modified part
  - The "E" letter indicates an aircraft validity change for the DU: The list of MSNs for which the DU is effective has been changed compared to the previous LEDU, by addition or deletion of one or several MSN
- The “Localization” field that allows localizing the DU in the manual with the product structure of the manual
- The "T" field (Temporary Information) that contains a cross if the associated DU is a TDU
- The "DU title" that provides the title of the DU
- The “DU identification” that identifies the DU with its own unique identification number or the GDU with its own unique code.

- The “DU date” that indicates when the DU has been released
- The DU criteria which lists the technical or operational criteria for which the DU and solution is applicable to.
- The “Applicable to” which provides the list of aircraft this DU and solution is applicable to
- The “Impacted by TDU” which is the identification of the TDU superseding the DU

LIST OF EFFECTIVE TEMPORARY DOCUMENTARY UNITS (LETDU) - PAPER ONLY

Ident.: GEN-00013803.0001001 / 23 JUN 15
Applicable to: ALL

The List of Effective Temporary Documentary Units (LETDU) provides a summary of the Temporary DU impacting the section.

The LETDU consists of:
- The "M" field that may provide the following Evolution Code:
  - The "N" letter indicates a new TDU introduced by the revision
  - The "R" letter indicates a revised TDU: The content of the TDU is updated by the revision. A vertical line in the margin of the TDU locates the modified part
  - The "E" letter indicates an aircraft validity change for the TDU: The list of MSNs the TDU is applicable to has been changed compared to the previous LETDU, by addition or deletion of one or several MSN
- The “Localization” field that allows localizing the TDU in the manual with the product structure of the manual
- The “TDU Title” that provides the title of the TDU
- The “TDU identification” that identifies the TDU with its identification number with its own unique code
- The “TDU date” that indicates when the TDU has been released
- The TDU criteria which lists the technical or operational criteria, the it is applicable to
- The “Applicable to” which provides the list of aircraft this TDU is applicable to
- The “Impacted DU” which is the Identification of DU superseded by the TDU
- The “Reason for issue” of the TDU

Note: *1. TDU is displayed on a yellow background*
2. within the QRH the TDU replaces the impacted DU

AIRCRAFT ALLOCATION TABLE (AAT) - PAPER ONLY

Ident.: GEN-00013804.0001001 / 23 JUN 15
Applicable to: ALL

The Aircraft Allocation Table (AAT) provides a view of the fleet covered in the FCOM. For each aircraft, the AAT provides its MSN, its registration number and the model.

LIST OF MODIFICATIONS (LOM) - PAPER ONLY

Ident.: GEN-00013805.0001001 / 23 JUN 15
Applicable to: ALL

The List of Modifications (LOM) lists the criteria (Modification Proposal (MP) or Service Bulletins (SB)) which the installation on the aircraft affects the FCOM.

Note: *Each MP has one or more associated MODs. The MP/MOD correlation is available in AirN@v / Engineering.*

The LOM also indicates:
- The title of the criteria
- The date of incorporation of the criteria in the FCOM
- The list of aircraft that have the criteria
- The "M" field that may indicate the following evolution code
  - The "E" letter indicates an aircraft validity change of the criteria. The list of aircraft to which the criteria applies has changed compared to the previous FCOM revision, by addition or deletion of one or several aircraft.
  - The "N" letter indicates new criteria added by this FCOM revision
  - The "R" letter indicates a change in the criteria title or associated SB

FCOM USE AND ORGANIZATION

Ident.: GEN-00012688.0001001 / 21 MAR 16
Applicable to: ALL

DEFINITIONS OF WARNINGS, CAUTIONS AND NOTES

The following are the official definitions of warnings, cautions and notes taken directly from the JAR25/CS-25 and applicable to Airbus flight operation documentation:

WARNING	An operating procedure, technique, etc. that may result in personal injury or loss of life if not followed.
CAUTION	An operating procedure, technique, etc. that may result in damage to equipment if not followed.

NOTE	An operating procedure, technique, etc. considered essential to emphasize. Information contained in notes may also be safety related.

INFORMATION TYPE AND LAYERS

The FCOM has technical information that may be used for:
- Flight crew operations in flight, or on ground
- Airlines operations on ground
- Training.

To take the above-noted objectives into account, the FCOM is organized in three layers as follows:
- Layer 1: "Need to know"
  Layer 1 presents information that is necessary in the cockpit.
- Layer 2: "Nice to know"
  Layer 2 presents information that is used as a reference, in order to fully understand the logic of the aircraft and pilot interfaces.
- Layer 3: Detailed information
  Layer 3 provides more detailed explanations, that are not necessarily needed in flight.

Note: *For paper only, the following examples show the visual characteristics of each kind of layer*

EXAMPLE	- Text in layer 1 Layer 1 is the default layer. No symbology when not following layer 2 or layer 3 information.

L2

EXAMPLE	- Text in layer 2

L3

EXAMPLE	- Text in layer 3

L1

EXAMPLE	- Text in layer 1 (as this text follows a text in layer 2 or 3, symbology "L1")

OPTIONAL EQUIPMENT

The legend ◁✻ (if installed) indicates that a paragraph or an illustration is applicable only if the related optional equipment is installed.

FCOM FORMAT AND STYLE INFORMATION - PAPER ONLY

REVISION MARK

In the paper format, a vertical bar in the margin of the DU identifies the modified part. Each vertical bar has a numerical index that refers to the associated reason of the change in the Summary of Highlight.
This Summary of Highlight lists all the changes and associated reasons of the change (if necessary) that the revision has introduced.

TOC INDEXING

In the paper page footer, the TOC indexing is of the following type:

A	:	The paper page contains the whole "A" TOC entry content
A to B	:	The paper page contains the whole "A" and "B" TOC entries contents
A →	:	The "A" TOC entry content starts on this paper page and continues on the following paper page
← A	:	The "A" TOC entry content starts on a previous paper page and finishes on this paper page
← A →	:	The "A" TOC entry content starts on a previous paper page and continues on the following paper page
A to C→	:	The paper page contains the whole "A" and "B" TOC entries contents but the "C" TOC entry content starts on this paper page and continues on the following paper page
← A to C	:	The paper page contains the whole "B" and "C" TOC entries contents but the "A" TOC entry content starts on a previous paper page and finishes on this paper page
← A to C →	:	The paper page contains the whole "B" TOC entry content but the "A" TOC entry content starts on a previous paper page and finishes on this paper page and the "C" TOC entry content starts on this paper page and continues on the following paper page

Note: *1. The indexes follow the alphabetical order: A, B, C, ..., Z, AA, AB, AC, ..., AZ, BA, BB, BC, ...*
2. For each subsection, the index starts again from A.
3. When a TOC entry content continues on the following paper page, the text "Continued on the following page" is also indicated.

FCOM REVISIONS

Ident.: GEN-00012634.0001001 / 09 NOV 20
Applicable to: ALL

FCOM REVISION

FCOM revisions are issued to add, update, or revise information. The Operator determines the revision periodicity.
When necessary, a revision may be issued in between the defined periodicity (e.g. need for urgent update).
A vertical bar appears to the left of all revised parts of the manual.

TEMPORARY INFORMATION

Some FCOM sections may need a temporary update (e.g. to explain a system behavior that will be modified by a future standard). In such cases, the applicable FCOM section is updated with a TDU.
Information contained in the TDU is highlighted in the manual and the initial content of the FCOM remains available for consultation and comparison and is highlighted (identification strip) as being impacted by the TDU.
A LEDU is provided in the FCOM.

OEB GENERAL DESCRIPTION

Applicable to: ALL

Ident.: GEN-A-00022458.0001001 / 09 NOV 20

DEFINITION

An Operations Engineering Bulletin is published to inform Operators of any deviations from initial design objectives that have a significant operational impact. An OEB provides the Operators with technical information and temporary operational procedures that take into account these deviations.

An OEB:
- Is temporary and usually focuses on one operational subject only
- Is included in the OEB section of the QRH so that the flight crew can easily access it
- At any time during the flight, if the OEB conditions are applicable, the flight crew must apply the operational procedure(s) that is in the QRH OEB section.

Ident.: GEN-A-00022459.0001001 / 09 NOV 20

TYPE OF OEB

OEBs can either be red or white, depending on their level of priority.

- RED OEBs are published to indicate that non-compliance with the recommended procedures may have a significant impact on the safe operation of the aircraft. The Operators shall provide all flight crews with these OEBs or their content without delay.
- WHITE OEBs are published to indicate that non-compliance with the recommended procedures may have a significant impact on aircraft operation. Airbus recommends that the Operators apply these OEBs within 30 days from the date of publication of these OEBs.

The information in OEBs is recommended by Airbus. If the OEB has an impact on the airworthiness of the aircraft, Airbus also issues a Temporary Revision of the Airplane Flight Manual. If the procedures contained in the red OEB differ from the procedures in the AFM TR, the approved AFM TR remains the reference.
Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel the OEB when they become available.

Ident.: GEN-A-00022460.0001001 / 09 NOV 20

OEB CONTENT AND MANAGEMENT

OEB IN THE QRH

Each OEB includes all of the following items:
- The title of the OEB PROC
- The “ECAM ENTRY" field:
  This section identifies if one of the possible conditions to apply the OEB PROC is an ECAM warning/caution.
  The flight crew must disregard the ECAM procedure and/or STATUS of the ECAM alerts listed in the "ECAM ENTRY" field and must apply the QRH’s OEB procedure instead.
- The OEB operational procedure(s) that the flight crew must apply
- The technical explanation of the deviation from the initial design objectives.

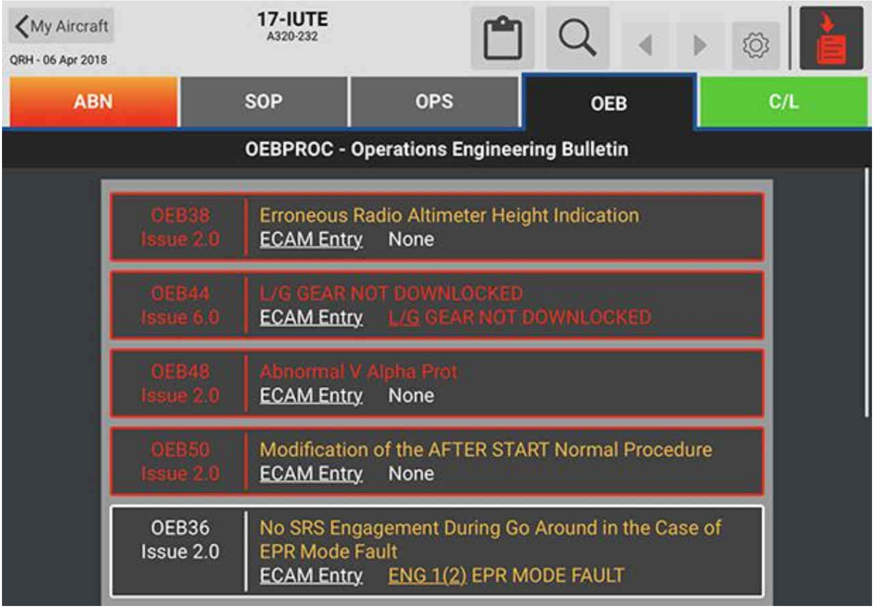
OEB IMMEDIATE ACTIONS

OEB Immediate Actions are actions that the flight crew must memorize, in order to be able to rapidly apply them, without referring the OEB.

OEB Immediate Actions are surrounded by a box in the OEB procedure, in order to enable the flight crew to easily identify them and are preceded by the phrase ‘IMMEDIATELY APPLY’.

QRH LIST OF EFFECTIVE OEBS

The LEOEB enables the flight crew to identify all the OEBs that are applicable to one specific aircraft.



OEBPROC - Operations Engineering Bulletin

OEB38 Issue 2.0	Erroneous Radio Altimeter Height Indication ECAM Entry None
OEB44 Issue 6.0	L/G GEAR NOT DOWNLOCKED ECAM Entry L/G GEAR NOT DOWNLOCKED
OEB48 Issue 2.0	Abnormal V Alpha Prot ECAM Entry None
OEB50 Issue 2.0	Modification of the AFTER START Normal Procedure ECAM Entry None
OEB36 Issue 2.0	No SRS Engagement During Go Around in the Case of EPR Mode Fault ECAM Entry ENG 1(2) EPR MODE FAULT

The QRH LEOEB includes:

- The "Identification" field that identifies the OEB number and its issue number. The identification number and title of red OEBs are in red font in the eQRH. The identification number and title of white OEBs are in white font in the eQRH. This identification field enables the flight crew to easily identify the applicable OEBs before flight.

  Note: *OEBs are listed in numerical order and red OEBs are displayed before white OEBs.*

- The "Title" field provides the OEB title and the "ECAM Entry" part of the OEB PROC. This enables the flight crew to easily identify the ECAM procedure that is affected by the OEB.

CAUTION	When Airbus provides the Operator with the LEOEB, the information “ECAM Entry ” does not necessarily mean that (for Operators that use the OEB REMINDER function) the Operator’s maintenance personnel activated the OEB REMINDER codes for this OEB onboard the aircraft. It is the Operator’s responsibility to define an appropriate process to provide the flight crew with confirmation that the OEB REMINDER codes are activated for the ECAM alerts affected by OEBs.

TDU GENERAL DESCRIPTION

Ident.: GEN-00023795.0001001 / 29 NOV 19
Applicable to: ALL

A TDU in the FCOM informs the flight crew about a temporary change in a normal Standard Operating Procedure, Advisory or Limitations. The TDU contains the reason for change in order to better understand and memorize this temporary change.

The TDU contains several indications:
- The date of application of the new or revised content
- The reason for change explains why the section is updated with a short general description of the malfunction
- The yellow dash line indicates the affected documentary unit
- When applicable, the arrow link provides a link to the previous content.

TAB GENERAL DESCRIPTION

Ident.: GEN-00023794.0001001 / 29 NOV 19
Applicable to: ALL

A TAB is a description of a system behavior that temporarily deviates from the intended system design and that the flight crew can notice.
The TAB enables the flight crew to better recognize, understand and if applicable, react to the abnormal system behavior in order to avoid any undue operational delay.
When applicable, temporary abnormal behaviors are described in the related section of the Aircraft System in a dedicated product folder identified as "Temporary Abnormal Behaviors".
Each TAB contains a description of the malfunction with alternative instruction called "Operational recommendation" (if applicable).

T/O	Takeoff
T2CAS	Traffic and Terrain Collision Avoidance System
T3CAS	Traffic and Terrain Collision Avoidance System
TA	Traffic Advisory
TAB	Temporary Abnormal Behavior
TAC	Taxiing Aid Camera
TACAN	Tactical Air Navigation
TAD	Terrain Awareness Display
TAS	True Air Speed
TAT	Total Air Temperature
TAU	Time to intercept
TAWS	Terrain Awareness and Warning System
TBD	To Be Determined
TBV	Transient Bleed Valve
TCA	Turbine Cooling Air
TCAS	Traffic Alert and Collision Avoidance System
TCC	Turbine Case Cooling
TCF	Terrain Clearance Floor

Continued on the following page

Continued from the previous page

Abbreviation	Term
TCM	Thrust Control Malfunction
TCMA	Thrust Control Malfunction Accommodation
TDU	Temporary Documentary Unit
TEL	Telephone
TEMP	Temperature
TERR	Terrain
TFLEX	Flexible Temperature
TGT	Target
THR	Thrust
THRT	Threat
THS	Trimmable Horizontal Stabilizer
THSA	Trimmable Horizontal Stabilizer Actuator
TK	Tank, Track
TLA	Throttle Lever Angle
TLU	Travel Limitation Unit
TMPY	Temporary
TMR	Timer
TO	Takeoff
TOC	Table of Contents
TOD	Takeoff Distance
TODA	Takeoff Distance Available
TOGA	Takeoff - Go-Around
TOR	Takeoff Run
TORA	Takeoff Run Available
TOS	Takeoff Surveillance
TOW	Takeoff Weight
T-P	Turn Point
TPIS	Tire Pressure Indicating System
TR	Transformer Rectifier
TRANS	Transition
TREF	Flat Rating Temperature
TRK	Track
TROPO	Tropopause
TRU	Transformer Rectifier Unit
TRV	Travel
TSM	Trouble Shooting Manual
TTG	Time to Go
TVMC	Minimum Control Speed Temperature
TWY	Taxiway

U

Abbreviation	Term
UNLK	Unlock
UP	Up, Upper
USB	Universal Serial Bus
UTC	Universal Coordinated Time

V

Abbreviation	Term
V/DEV	Vertical Deviation
V/S	Vertical Speed
V1	Decision Speed
V2	Takeoff Safety Speed
VAPP	Approach Speed
VBV	Variable Bypass Valve
VDEV	Vertical Deviation
VDL	VHF Datalink
VERT	Vertical
VERT REV	Vertical Revision
VFE	Maximum Speed for each Flap configuration
VFTO	Final Takeoff Speed
VHF	Very High Frequency
VIB	Vibration
VIP	Vertical Intersection Point
VLE	Maximum Landing Gear Extended Speed
VLS	Lowest Selectable Speed
VM	Maneuvering Speed
VMAX	Maximum Allowable Speed
VMC	Visual Meteorological Conditions
VMCA	Minimum Control Speed in the Air
VMCG	Minimum Control Speed on Ground
VMCL	Minimum Control Speed at Landing
VMIN	Minimum Operating Speed
VMO	Maximum Operating Speed
VMU	Minimum Unstick Speed
VNAV	Vertical Navigation
VOR	VHF Omnidirectional Range
VOR-D	VOR-DME
VR	Rotation Speed
VREF	Landing Reference Speed
VS	Reference Stalling Speed

Continued on the following page

Continued from the previous page

Abbreviation	Term
VS1G	Stall Speed at 1g load factor
VSC	Vacuum System Controller
VSI	Vertical Speed Indicator
VSV	Variable Stator Vane
VSW	Stall Warning Speed
VU	Visual Unit, Virtual Unit

W

Abbreviation	Term
W/S	Wind Shear
WAI	Wing Anti-Ice
WARN	Warning
WBC	Weight and Balance Computer
WBS	Weight and Balance System
WD	Warning Display
WHC	Window Heat Computer
WPT	Waypoint
WS	Windshear
WSHLD	Windshield
WT	Weight
WTB	Wing Tip Brake
WX	Weather
WXR	Weather Radar

X

Abbreviation	Term
XFR	Transfer
xLS	x Landing System (e.g. ILS, GLS, ...)
XPDR	Transponder
XPNDR	Transponder
XTK	Crosstrack Error

Y

Abbreviation	Term

Z

Abbreviation	Term
ZFCG	Zero Fuel Center of Gravity
ZFW	Zero Fuel Weight
ZFWCG	Zero Fuel Weight Center of Gravity field

SYMBOLS

Abbreviation	Term
<	less than
>	more than
≤	less than or equal to
≥	more than or equal to
=	equal to

GENERAL

Ident.: DSC-20-10-00000284.0003001 / 13 DEC 10

Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05345

The A319 is a subsonic, medium-range, civil transport aircraft.

ENGINES

Ident.: DSC-20-10-00000285.0001001 / 13 DEC 10

Applicable to: ALL

The aircraft has two high bypass turbofan engines mounted under the wings.

COCKPIT

Ident.: DSC-20-10-00000286.0002001 / 13 DEC 10

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The cockpit is designed for a two-member crew. It also has a place for 2 observers.

CABIN

Ident.: DSC-20-10-00000287.0007001 / 05 FEB 15

Applicable to: ALL

The passenger seating layout may vary, depending on operating requirements.

CARGO

Ident.: DSC-20-10-00000289.0001001 / 13 DEC 10

Applicable to: ALL

Two cargo compartments are under the cabin floor.

GENERAL ARRANGEMENT

Ident.: DSC-20-20-00000290.0001001 / 21 MAR 16
Applicable to: ALL

This subchapter gives the principal aircraft dimensions, location of unpressurized areas, antennas, ground service connections, and ground maneuvering characteristics.

180 DEGREES TURN ON RUNWAY

Ident.: DSC-20-30-00021674.0002001 / 06 APR 18

3 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

With the recommended 180 ° turn technique, on dry runway, the approximate turn width is 30 m (99 ft) without margin.

Note: *The flight crew should consider additional margin when the runway is wet or contaminated.*

For more information about the 180 ° Turn Technique, *Refer to FCTM/PR-NP-SOP-100 180 degrees Turn on Runway*.

180 DEGREES TURN ON RUNWAY

Ident.: DSC-20-30-00021674.0001001 / 06 JUN 17

4 **Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

With the recommended 180 ° turn technique, on dry runway, the approximate turn width is 24 m (79 ft) without margin.

Note: *The flight crew should consider additional margin when the runway is wet or contaminated.*

For more information about the 180 ° Turn Technique, *Refer to FCTM/PR-NP-SOP-100 180 degrees Turn on Runway*.

GENERAL

Ident.: DSC-21-10-10-00017767.0001001 / 21 MAR 16
Applicable to: ALL

The air conditioning system is fully automatic.
It provides continuous air renewal and maintains a constant, selected temperature in the following three zones : COCKPIT, FWD CABIN, AFT CABIN. These three zones are independently controlled.

Air is supplied by the pneumatic system, via:
- Two pack flow control valves,
- Two packs,
- The mixing unit, which mixes the air that comes from the cabin and the packs.

Air is then distributed to the cockpit and the cabin.
In an emergency, a ram air inlet can provide ambient air to the mixing unit.
The temperature in the flight deck and in the cabin can be selected from the cockpit's AIR COND panel. Temperature regulation of the temperature is ensured by a zone controller and two pack controllers, or two Air Conditioning System Controller (ACSC) ◁❄ .
Temperature regulation is optimized via the hot air pressure regulating valve, and the trim air valves that add hot air, tapped upstream of the packs, to the air coming from the mixing unit.
A temperature control panel ◁❄ is also available on the Forward Attendant Panel (FAP). During cruise, the cabin crew can modify each cabin zone temperature that is selected from the cockpit, with a limited authority of ± 2.5 °C. (± 4.5 °F).
Low-pressure air is supplied to the mixing unit by a ground connection.

AIR CONDITIONING PACK

Ident.: DSC-21-10-20-00017768.0001001 / 21 MAR 16
Applicable to: ALL

The two packs operate automatically and independently of each other. Pack operation is controlled by signals coming from the pack controller or the Air Conditioning System Controller (ACSC) ◁✳ .
Warm pre-conditioned bleed air enters the cooling path via the pack flow control valve, and is ducted to the primary heat exchanger.
Then, the cooled bleed air enters the compressor section of the air-cycle machine and is compressed to a higher pressure and temperature.
It is cooled again in the main heat exchanger and enters the turbine section, where it expands and, in expanding, generates power to drive the compressor and cooling air fan.
The removal of energy during this process reduces air temperature, resulting in very low air temperature at turbine discharge.
L3 A water separator system dries the air before it enters the turbine section.

PACK FLOW CONTROL VALVE

Ident.: DSC-21-10-20-00017769.0001001 / 24 AUG 18
Applicable to: ALL

This valve is pneumatically-operated and electrically-controlled. It regulates the air flow in accordance with signals received from the pack controllers or the ACSC ◁✱ .
In the absence of air pressure, a spring keeps the valve closed.
The valve closes automatically in case of pack overheat (on ground only), engine start, or operation of the fire or ditching pushbutton. The valve is controlled from the AIR COND panel.

EMERGENCY RAM AIR

Ident.: DSC-21-10-20-00000301.0001001 / 20 DEC 16
Applicable to: ALL

An emergency ram air inlet ventilates the cockpit and cabin to remove smoke, or if both packs fail.
The emergency ram air inlet valve is controlled by the RAM AIR pushbutton on the AIR COND panel.
This pushbutton opens the ram air valve, provided that ditching is not selected.
When the RAM AIR pushbutton is ON : The outflow valve opens about 50 %, provided that it is under automatic control and ΔP is less than 1 PSI. The outflow valve does not automatically open if it is under manual control, even if ΔP is less than 1 PSI. If ΔP is greater than 1 PSI, the check valve located downstream the ram air door will not open, even if the ram air door has been selected open.
No airflow will then be supplied.

MIXER UNIT

Ident.: DSC-21-10-20-00000302.0001001 / 21 MAR 16
Applicable to: ALL

This unit mixes cold fresh air from the packs with the cabin air being recirculated through recirculation fans. The mixer unit is also connected to the emergency ram air inlet and the low pressure ground inlets.

HOT-AIR PRESSURE-REGULATING VALVE

Ident.: DSC-21-10-20-00000303.0002001 / 05 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

This valve regulates the pressure of hot air, tapped upstream of the packs.
It is pneumatically-operated and electrically-controlled from the HOT AIR pb-sw on the AIR COND panel. In the absence of air, a spring keeps the valve closed.

The valve closes automatically, if:
- The duct overheats, or
- The cockpit trim air valve fails, or
- The zone controller fails.

The valve remains operative, even if either the forward or aft cabin trim air valve fails.

HOT-AIR PRESSURE-REGULATING VALVE

Ident.: DSC-21-10-20-00000303.0003001 / 05 MAY 22
3 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

This valve regulates the pressure of hot air, tapped upstream of the packs.
It is pneumatically-operated and electrically-controlled from the HOT AIR pb-sw on the AIR COND panel. The ACSC 1 regulates this valve. In the absence of air, a spring keeps the valve closed.

The valve closes automatically, if:
- Both lanes of ACSC 1 or ACSC 2 fail, or
- The duct overheats, or
- At least two trim air valves fail.

The valve remains operative, even if either the forward or aft cabin trim air valve fails.

TRIM AIR VALVES

Ident.: DSC-21-10-20-00017771.0001001 / 21 MAR 16
Applicable to: ALL

These valves are electrically-controlled by the zone controller or the ACSC ◁ . A trim air valve, associated with each zone, adjusts the temperature by adding hot air.
The cockpit trim air valve is controlled by the ACSC 1 ◁ , and the cabin trim air valves are controlled by the ACSC 2 ◁ .

Intentionally left blank

GENERAL

Ident.: DSC-21-10-30-00017772.0001001 / 21 MAR 16
Applicable to: ALL

Temperature regulation is automatic and controlled by one zone controller and two pack controllers, or the ACSC ◁ .

PACK CONTROLLER

Ident.: DSC-21-10-30-00000306.0002001 / 15 FEB 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Each pack controller regulates the temperature of its associated pack, in accordance with a demand signal from the zone controller, by modulating the bypass valve and the ram air inlet flaps.
The ram air inlet flaps close during takeoff and landing to avoid ingestion of foreign matter.

Note: *During takeoff, the ram air inlet flaps close when TO power is set and the main landing gear struts are compressed.*
During landing they close as soon as the main landing gear struts are compressed, as long as speed is at or above 70 kt.
They open 20 s after the speed drops below 70 kt.

The pack controllers also regulate flow by modulating the associated pack flow control valve.

ZONE CONTROLLER

Ident.: DSC-21-10-30-00000307.0001001 / 05 MAR 19
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

PACK FLOW CONTROL

The crew can use the PACK FLOW selector to adjust the pack flow for the number of passengers and for external conditions.

Whatever the crew selects, the system delivers higher flow for any of the following circumstances:
- In single-pack operation,
- When the APU is supplying bleed air.

The system delivers normal flow if the crew selects LO flow and the temperature demand cannot be satisfied.

ENGINE PRESSURE DEMAND

When the cooling demand in one zone cannot be satisfied, if the bleed pressure is too low, the zone controller sends a pressure demand signal to both Engine Interface Units (EIU) to increase the minimum idle and to raise the bleed pressure.

APU FLOW DEMAND

When the APU bleed valve is open, the zone controller signals the APU's Electronic Control Box (ECB) to increase the APU flow output when any zone temperature demand cannot be satisfied.

TEMPERATURE REGULATION

Ident.: DSC-21-10-30-00017773.0001001 / 21 MAR 16
Applicable to: ALL

Temperature regulation is achieved by the zone controller or the ACSC ◁ .
The zone controller regulates the temperature of the two cabin zones and the cockpit. The ACSC 2 ◁ regulates the temperature of the two cabin zones, and the ACSC 1 ◁ regulates the cockpit temperature.

BASIC TEMPERATURE REGULATION

The flight crew uses the temperature selectors on the air conditioning panel to select the reference temperatures. The zone controller or the ACSC ◁ computes a temperature demand from the selected temperature and the actual temperature. The reference temperatures are then fine tuned for each cabin zone through the temperature control panel ◁ installed on the FAP.

The actual temperature is measured by sensors:
- In the cockpit, for the cockpit zone;
- In the lavatory extraction circuit and galley ventilation system, for the cabin.

A signal corresponding to the lowest demanded zone temperature goes to the pack controller or the ACSC ◁ , which then make both packs supply the required outlet temperature.

OPTIMIZED TEMPERATURE REGULATION

The zone controller or the ACSC ◁ optimizes temperature by acting on the trim air valves.
The temperature selection range is from 18 °C (64 °F) to 30 °C (86 °F).

AIR CONDITIONING SYSTEM CONTROLLERS

Ident.: DSC-21-10-30-00017775.0001001 / 20 DEC 16
Applicable to: MSN 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11597

Each air conditioning system controller regulates the temperature of its associated pack, by modulating the bypass valve and the ram air inlet flap.
The ram air inlet flap closes during takeoff and landing to avoid the ingestion of foreign matter.

Note: *During takeoff, the ram air inlet flap closes when takeoff power is set, and the main landing gear struts are compressed.*
During landing, it closes as soon as the main landing gear struts are compressed, as long as speed is at or above 70 kt.
It opens 20 s after the speed drops below 70 kt.

The air conditioning system controllers also regulate flow by modulating the associated pack flow control valve.

PACK FLOW CONTROL

The flight crew can use the PACK FLOW selector to adjust the pack flow for the number of passengers and for external conditions.

Whatever the crew selects, the system delivers higher flow for any of the following circumstances:
- In single-pack operation,
- When the APU is supplying bleed air.

The system delivers normal flow if the flight crew selects LO flow and the temperature demand cannot be satisfied.

ENGINE PRESSURE DEMAND

When the cooling demand in one zone cannot be satisfied, if the bleed pressure is too low, the air conditioning system controller sends a pressure demand signal to both Engine Interface Units (EIU) to increase the minimum idle and to raise the bleed pressure.

APU FLOW DEMAND

When the APU bleed valve is open, the air conditioning system controller signals the APU's Electronic Control Box (ECB) to increase the APU flow output when any zone temperature demand cannot be satisfied.

AIR CONDITIONING SYSTEM CONTROLLERS

Ident.: DSC-21-10-30-00017775.0019001 / 20 DEC 16
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

Each air conditioning system controller regulates the temperature of its associated pack, by modulating the bypass valve and the ram air inlet flap.
The ram air inlet flap closes during takeoff and landing to avoid the ingestion of foreign matter.

Note: *During takeoff, the ram air inlet flap closes when takeoff power is set, and the main landing gear struts are compressed.*
During landing, it closes as soon as the main landing gear struts are compressed, as long as speed is at or above 70 kt.
It opens 20 s after the speed drops below 70 kt.

The air conditioning system controllers also regulate flow by modulating the associated pack flow control valve.

PACK FLOW CONTROL

The flight crew can use the ECON FLOW pb to adjust the pack flow for the number of passengers and for external conditions.

Whatever the crew selects, the system delivers higher flow for any of the following circumstances:
- In single-pack operation,
- When the APU is supplying bleed air.

The system delivers normal flow if the flight crew selects ECON flow and the temperature demand cannot be satisfied.

ENGINE PRESSURE DEMAND

When the cooling demand in one zone cannot be satisfied, if the bleed pressure is too low, the air conditioning system controller sends a pressure demand signal to both Engine Interface Units (EIU) to increase the minimum idle and to raise the bleed pressure.

APU FLOW DEMAND

When the APU bleed valve is open, the air conditioning system controller signals the APU's Electronic Control Box (ECB) to increase the APU flow output when any zone temperature demand cannot be satisfied.

GENERAL

Ident.: DSC-21-10-40-00000309.0001001 / 15 FEB 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Each controller consists of a primary channel that is normally in control and a secondary channel that acts as a backup if the primary channel fails.

GENERAL

Ident.: DSC-21-10-40-00000309.0002001 / 21 MAR 16
1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Each controller is comprised of two lanes. One lane controls the system, the other takes over full control, in case of an active lane failure.

ZONE CONTROLLER

Ident.: DSC-21-10-40-00000310.0001001 / 15 FEB 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

PRIMARY CHANNEL FAILURE

The secondary channel operates as backup.
The flow setting function and optimized temperature regulation are not available. HOT AIR and TRIM AIR valves close.
The zones are controlled to 24 °C (76 °F) (backup regulation). Pack 1 controls the cockpit temperature. Pack 2 controls the FWD and AFT cabin temperatures.
ALTN MODE appears on the ECAM (Electronic Centralized Aircraft Monitoring) COND page.

SECONDARY CHANNEL FAILURE

This has no effect on zone temperature regulation.
Backup mode is lost.

PRIMARY AND SECONDARY CHANNEL FAILURE

Optimized and backup temperature regulation is lost.
The packs deliver a fixed temperature: 20 °C (68 °F) for pack 1, 10 °C (50 °F) for pack 2. The failure removes all information from the ECAM COND page, which then displays PACK REG.

PACK CONTROLLERS

Ident.: DSC-21-10-40-00000311.0001001 / 15 FEB 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

PRIMARY CHANNEL FAILURE

The secondary computer operates as a backup.

Regulation is not optimized.
Pack flow is fixed at the previous setting.

SECONDARY CHANNEL FAILURE

This failure has no effect on pack regulation. Backup mode is lost.
ECAM signals related to the corresponding pack are lost.

PRIMARY AND SECONDARY CHANNEL FAILURE

As a backup, corresponding pack outlet temperature is controlled by the anti-ice valve and is stabilized to a temperature between 5 °C (41 °F) and 30 °C (86 °F) in a maximum of 6 min.
ECAM signals, related to the corresponding pack, are lost.

AIR CONDITIONING SYSTEM CONTROLLERS ⧏

Ident.: DSC-21-10-40-00018747.0001001 / 21 MAR 16
Applicable to: ALL

ONE LANE FAILURE

No effect, as the second lane takes over.

BOTH LANES FAILURE

The related pack is lost, and the hot air pressure-regulating valve and associated trim air valves close.

AIR CYCLE MACHINE FAILURE

Ident.: DSC-21-10-40-00000312.0002001 / 15 FEB 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

If the Air Cycle Machine (ACM) fails (compressor/turbine seizure), the affected pack may be operated in heat exchanger cooling mode.
Warm pre-conditioned bleed air enters the cooling path via the pack valve and goes to the primary heat exchanger. Then, the main part of the cooled air goes directly downstream of ACM turbine through the bypass valve, and the rest goes through the failed ACM.
The ACM seizure reduces the pack flow.

As for normal pack operation:
- The pack controller regulates temperature, in accordance with zone controller demand, by modulating the bypass valve and the ram air inlet flap.
- The zone controller regulates the hot air flow through the hot air valves to optimize cockpit/cabin temperature regulation. Hot air flow is lower than in normal pack operation, because pack flow is reduced.

AIR CYCLE MACHINE FAILURE

Ident.: DSC-21-10-40-00000312.0003001 / 21 MAR 16
2 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

If the Air Cycle Machine (ACM) fails (compressor/turbine seizure), the affected pack may be operated in heat exchanger cooling mode.
Warm pre-conditioned bleed air enters the cooling path via the pack valve and goes to the primary heat exchanger. Then, the main part of the cooled air goes directly downstream of ACM turbine through the bypass valve, and the rest goes through the failed ACM.
The ACM seizure reduces the pack flow.

As for normal pack operation :
- The air conditioning system controller regulates temperature by modulating the bypass valve and the ram air inlet flap.
- The air conditioning system controller regulates the hot air flow through the trim air valves to optimize cockpit/cabin temperature regulation. Hot air flow is lower than in normal pack operation, because pack flow is reduced.

HOT AIR PRESSURE REGULATING VALVE FAILURE

Ident.: DSC-21-10-40-00000313.0001001 / 21 MAR 16
Applicable to: ALL

Failed open : No effect.

Failed closed : Optimized regulation is lost. Trim air valves are driven to the fully closed position. Pack 1 controls the cockpit temperature to the selected value and pack 2 controls the cabin temperature (FWD and AFT) to the mean value of the selected temperatures.

TRIM AIR VALVE FAILURE

Ident.: DSC-21-10-40-00000314.0001001 / 21 MAR 16
Applicable to: ALL

Optimized temperature regulation of the corresponding zone is lost.

Intentionally left blank

(1) Zone temperature selector

- 12 o'clock position: 24 °C (76 °F)
- COLD position: 18 °C (64 °F)
- HOT position: 30 °C (86 °F).

(2) HOT AIR pb

ON :	The valve regulates hot air pressure.
OFF :	The valve closes, and the trim air valves close. The FAULT circuit is reset.
FAULT :	The FAULT light comes on amber, along with an associated ECAM caution, when duct overheat is detected. The fault circuit detects an overheat when the duct temperature reaches 88 °C (190 °F) once. The valve and trim air valves close automatically. The FAULT light goes off when the temperature drops below 70 °C (158 °F), and the flight crew selects OFF.

(3) PACK pb-sw

ON : The pack flow control valve is automatically-controlled.

It opens, except in the following cases:

- Upstream pressure below minimum
- Compressor outlet overheat
- Engine start sequence:

1. If the crossbleed valve is closed, the valve located on the starting engine side immediately closes, when the MODE selector is set to IGN (or CRK)
2. It remains closed on the starting engine side (provided the crossbleed valve is closed) when:
   - The MASTER sw is set to ON (or MAN START pb is set to ON)
   - The start valve is open
   - N2 < 50 %.

   Note: *If the crossbleed valve is open at engine start, both pack flow control valves close.*
3. On ground, reopening of the valves is delayed for 30 s to avoid a supplementary pack closure cycle during second engine start.

- FIRE pb, of the engine on the related side, is pressed
- Ditching is selected.

OFF : The pack flow control valve closes.

FAULT lt : Comes on amber, and a caution appears on the ECAM, if the pack flow control valve position disagrees with the selected position, or in the case of compressor outlet overheat or pack outlet overheat.

(4) PACK FLOW selector

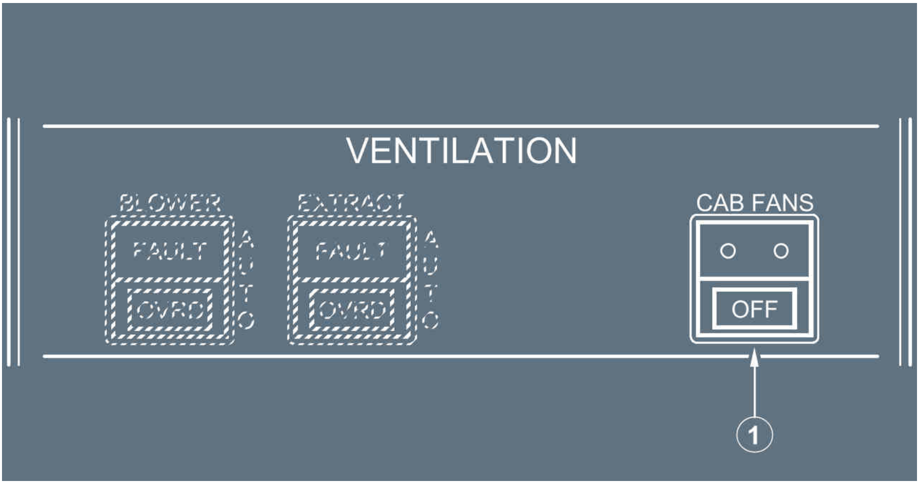
- Permits the selection of pack valve flow, according to the number of passengers and ambient conditions (smoke removal, hot or wet conditions)
  LO (80 %) – NORM (100 %) – HI (120 %)
- Manual selection is irrelevant in single pack operation, or with APU bleed supply. In these cases, HI is automatically selected
- If LO is selected, the pack flow can be automatically selected up to 100 % when the cooling demand cannot be satisfied.

(5) RAM AIR pb (guarded)

ON : The ON light comes on white.

If the DITCHING pb, on the CABIN PRESS panel, is in normal position:
- The emergency ram air inlet opens
- If Δp ≥ 1 PSI: The outflow valve control remains normal. No emergency ram air flows in
- If Δp < 1 PSI: The outflow valve opens to about 50 % when under automatic control. It does not automatically open when it is under manual control. Emergency ram airflow is directly supplied to the mixer unit.

OFF: The emergency ram air inlet closes.



(1) CAB FAN pb

ON : The two cabin fans are on.

OFF: The two cabin fans are off.

(3) PACK pb-sw

ON : The pack flow control valve is automatically-controlled.

It opens, except in the following cases:
- Upstream pressure below minimum
- Compressor outlet overheat
- Engine start sequence:
    1. If the crossbleed valve is closed, the valve located on the starting engine side immediately closes, when the MODE selector is set to IGN (or CRK)
    2. It remains closed on the starting engine side (provided the crossbleed valve is closed) when:
        - The MASTER sw is set to ON (or MAN START pb is set to ON)
        - The start valve is open
        - N2 < 50 %.

        Note: *If the crossbleed valve is open at engine start, both pack flow control valves close.*
    3. On ground, reopening of the valves is delayed for 30 s to avoid a supplementary pack closure cycle during second engine start.
- FIRE pb, of the engine on the related side, is pressed
- Ditching is selected.

OFF : The pack flow control valve closes.

FAULT lt : Comes on amber, and a caution appears on the ECAM, if the pack flow control valve position disagrees with the selected position, or in the case of compressor outlet overheat or pack outlet overheat.

(4) ECON FLOW pb-sw

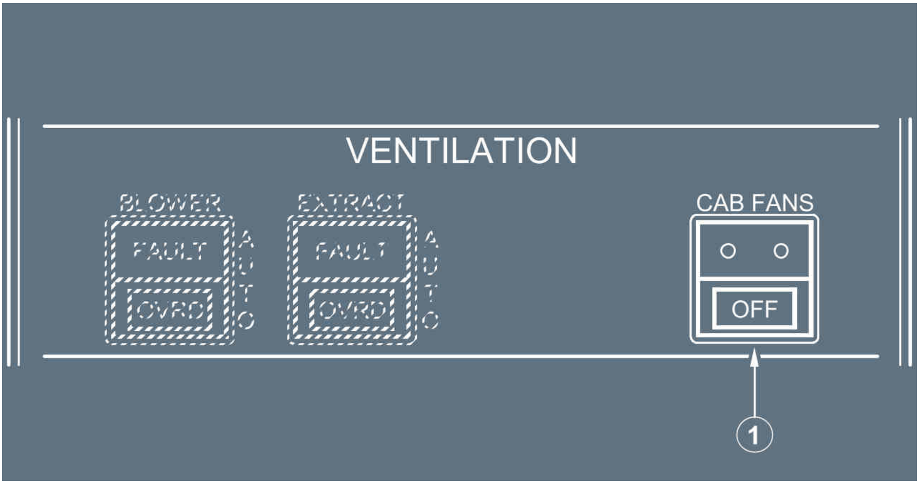
- Permits selection of ECON or normal pack valve flow according to number of passengers and ambient conditions (smoke removal, hot or wet conditions)
  ON ECON flow is selected, provides 80 % of the normal flow.
  OFF 100 % of the normal flow.
- The manual selection is irrelevant in single pack operation or with APU bleed supply. In these cases, the system delivers 120 % of the normal flow
- If ECON FLOW pb-sw is set to ON, the pack flow can be automatically selected up to 100 % (normal flow) when the cooling demand cannot be satisfied.

(5) RAM AIR pb (guarded)

ON : The ON light comes on white.

If the DITCHING pb, on the CABIN PRESS panel, is in normal position:
- The emergency ram air inlet opens
- If $\Delta p \geq 1$ PSI: The outflow valve control remains normal. No emergency ram air flows in
- If $\Delta p < 1$ PSI: The outflow valve opens to about 50 % when under automatic control. It does not automatically open when it is under manual control. Emergency ram airflow is directly supplied to the mixer unit.

OFF: The emergency ram air inlet closes.



(1) CAB FAN pb

ON : The two cabin fans are on.

OFF: The two cabin fans are off.

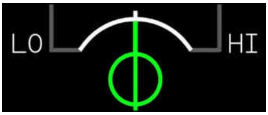
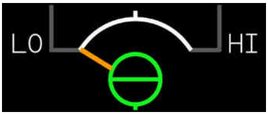
PACK FLOW INDICATIONS



The pack flow is normal.



There is no flow rate. The pack flow control valve is closed.

PACK FLOW CONTROL VALVE

The valve is open.

The valve is open, and disagrees with the control position.

The valve is fully closed.

The valve is fully closed, and disagrees with the control position.

BLEED USER INDICATION

User indication is normal.

RAM AIR valve and both pack flow control valves are fully closed.

ECAM COND PAGE

MEMO DISPLAY

Ident.: DSC-21-10-50-00016760.0001001 / 21 MAR 16

Applicable to: ALL

RAM AIR ON : This memo appears in green, if the RAM AIR pb-sw is ON.

GENERAL

Ident.: DSC-21-20-10-00017903.0001001 / 21 MAR 16
Applicable to: ALL

The cabin pressurization system has four general functions:
- Ground function : Fully opens the outflow valve on ground
- Prepressurization : During takeoff, increases cabin pressure to avoid a surge in cabin pressure during rotation
- Pressurization in flight : Adjusts cabin altitude, and rate of change to provide passengers with a comfortable flight
- Depressurization : After touchdown, gradually releases residual cabin overpressure before the ground function fully opens the outflow valve.

The system consists of:
- Two Cabin Pressure Controllers (CPC)
- One Residual Pressure Control Unit (RPCU ◁)
- One outflow valve, with an actuator that incorporates three motors (two for automatic operation, one for manual operation)
- One control panel
- Two safety valves.

Any one of the three independent electric motors may power the outflow valve.
Normally, one of the two cabin pressure controllers operates the outflow valve by means of its associated automatic motor.
In case of ditching, an override switch on the control panel allows the flight crew to close the outflow valve and all valves below the flotation line.
The flight crew can set the system to operate automatically, semi-automatically, or manually.
In normal operation, cabin pressurization is fully automatic.

AUTOMATIC OPERATION

Ident.: DSC-21-20-10-00000323.0001001 / 21 MAR 16
Applicable to: ALL

The flight crew monitors the operation of the system, but does nothing to control it. Air pressure in the cabin follows external schedules that the system receives as signals from the Flight Management and Guidance System (FMGS).
When FMGS data is not available for automatic pressurization, the crew only needs to select the landing field elevation.
The pressurization system then uses the manually-selected landing field elevation for internal schedules.

MANUAL OPERATION

Ident.: DSC-21-20-10-00000324.0001001 / 21 MAR 16
Applicable to: ALL

In manual mode, the flight crew controls the cabin altitude via the manual motor of the outflow valves, by operating controls on the pressurization control panel.

CABIN PRESSURE CONTROLLERS

Ident.: DSC-21-20-20-00000326.0001001 / 21 MAR 16
Applicable to: ALL

Two identical, independent, digital controllers automatically control the system, by maintaining the proper cabin pressure. They receive signals from the Air Data Inertial Reference System (ADIRS), the Flight Management and Guidance Computer (FMGC), the Engine Interface Unit (EIU), and the Landing Gear Control Interface Unit (LGCIU).

When the system is in automatic or semi-automatic mode, one controller is active, the other is on standby.

The controllers also generate signals for the Electronic Centralized Aircraft Monitoring (ECAM).

For operation in manual mode, each controller has a backup section, which is powered by an independent power supply in the controller N°1 position. This section also has a pressure sensor that generates the cabin altitude and pressure signal for the ECAM, when MAN mode is selected.

The controllers communicate with each other via a cross-channel link.

OUTFLOW VALVE

Ident.: DSC-21-20-20-00000327.0001001 / 21 MAR 16
Applicable to: ALL

The outflow valve is on the right-hand side of fuselage, behind the aft cargo compartment and below the flotation line.

The outflow valve assembly consists of a flush, skin-mounted, rectangular frame, carrying inward and outward opening flaps linked to the actuator. The actuator contains the drives of the two automatic motors and the manual motor. Either of two automatic motors operates the valve in automatic mode, and the manual motor operates it in manual mode.

In automatic mode, the operating controller signals the position of the valve to the ECAM.

In manual mode, the backup section of the N° 1 controller signals the position of the valve to the ECAM.

Note: *When the RAM AIR pushbutton is ON, and Δp is below 1 PSI, the system drives the outflow valve about 50 % open if it is under automatic control. If the system is under manual control, the outflow valve does not automatically open, even if Δp is below 1 PSI.*

SAFETY VALVES

Ident.: DSC-21-20-20-00000328.0001001 / 21 MAR 16
Applicable to: ALL

Two independent pneumatic safety valves prevent cabin pressure from going too high (8.6 PSI above ambient) or too low (1 PSI below ambient).

They are located on the rear pressure bulkhead, above the flotation line.

RESIDUAL PRESSURE CONTROL UNIT (RPCU ◁)

Ident.: DSC-21-20-20-00017788.0001001 / 21 MAR 16
Applicable to: ALL

The RPCU automatically depressurizes the aircraft in case of abnormal residual pressure on ground.
It automatically opens the outflow valve, when:
- The outflow valve is not fully open, and
- Both CPCs are failed, or manual mode is selected, and
- The aircraft is on ground, and
- All engines are shutdown, or all ADIRS indicate an airspeed below 100 kt.

AUTOMATIC PRESSURE CONTROL MODE

Ident.: DSC-21-20-30-00000329.0001001 / 04 DEC 18
Applicable to: ALL

GENERAL

- Two identical, independent, automatic systems (each consisting of a controller and its associated motors) control cabin pressure.
  Either system controls the single outflow valve.
  Only one controller operates at a time.

  An automatic transfer occurs:
  - 70 s after each landing.
  - If the operating system fails.
- The controller automatically controls the cabin pressure. It limits the cabin pressure to approximately 8 000 ft maximum during CRUISE mode and is optimized to support high airfield operations up to a pressure of 14 100 ft during ground, climb and descent phases.
- The controller normally uses the landing elevation and the QNH from the FMGC, and the pressure altitude from ADIRS.
  If FMGC data are not available, the controller uses the captain BARO Reference from the ADIRS and the LDG ELEV selection.
- Pressurization is assumed through the following modes:

GROUND (GN)

Before takeoff, and 55 s after landing, the outflow valve fully opens to ensure that there is no residual cabin pressure. At touchdown, any remaining cabin pressure is released at a cabin vertical speed of 500 ft/min.

TAKEOFF (TO)

To avoid a pressure surge at rotation, the controller pre-pressurizes the aircraft at a rate of 400 ft/min, until the ΔP reaches 0.1 PSI. At liftoff, the controller initiates the climb phase.

CLIMB (CL)

During climb, the cabin altitude varies according to a fixed pre-programmed law that takes into account the aircraft's actual rate of climb.

CRUISE (CR)

During cruise, the controller maintains cabin altitude at the level-off value, or at the landing field elevation, whichever is higher, but the cabin altitude target is limited to a maximum of approximately 8 000 ft.

DESCENT (DE)

During descent, the controller maintains a cabin rate of descent, such that the cabin pressure is equal to the landing field pressure +0.1 PSI, shortly before landing.
The maximum descent rate is 750 ft/min.

ABORT (AB)

If the aircraft does not climb after takeoff, the abort mode prevents the cabin altitude from climbing.
Cabin pressure is set back to the takeoff altitude +0.1 PSI.

PRESSURIZATION FLIGHT PROFILE

Ident.: DSC-21-20-30-00000331.0001001 / 08 SEP 15
Applicable to: ALL

	GROUND	PREPRESSU	PRESSURIZATION	DEPRESS	GROUND
CABIN V/S	/	-400 ft/min		+500 ft/min	/
CABIN ΔP	/	+0.1 PSI	⩽8.06 PSI	+0.1 PSI	/

MANUAL PRESSURE CONTROL MODE

Ident.: DSC-21-20-30-00000332.0001001 / 21 MAR 16
Applicable to: ALL

If both automatic systems fail, the flight crew may use the CABIN PRESS control panel to take over manual control of cabin pressurization.

- Release the MODE SEL pushbutton to select MAN, and
- Push the MAN V/S CTL switch UP or DN to increase or decrease cabin altitude.

The first of these actions cuts off power to the AUTO motors, and enables the MAN motor to control the outflow valve.

Note: 1. *Due to the slow operation of the outflow valves in manual mode, and the limited resolution of the outflow valves' position on the ECAM, the visual ECAM indication of a change in the outflow valves' position can take up to 5 s.*
2. *As the pressurization system is manually-controlled, the outflow valve does not open automatically at touchdown.*

DITCHING

Ident.: DSC-21-20-30-00017789.0001001 / 21 MAR 16
Applicable to: ALL

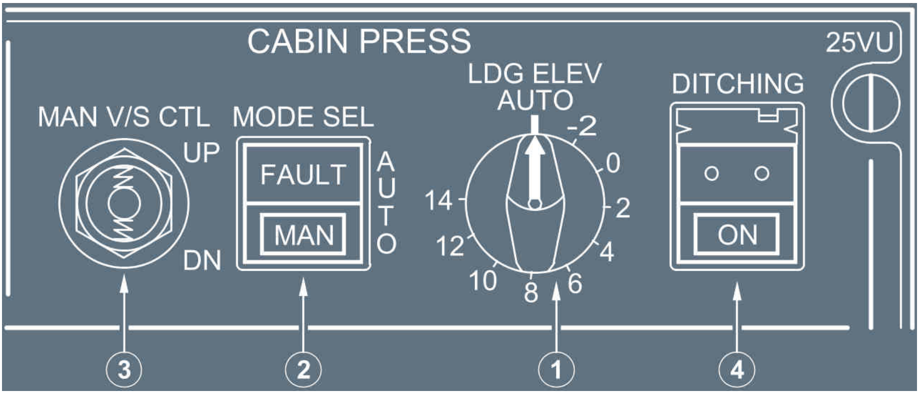
To prepare for ditching, the flight crew must press the DITCHING pb on the CABIN PRESS control panel to close the outflow valve, the emergency ram air inlet, the avionics ventilation inlet and extract valves, the pack flow control valves, and the FWD cargo outlet isolation valve ◁ .

Intentionally left blank

OVERHEAD PANEL

Ident.: DSC-21-20-40-00000334.0003001 / 07 MAY 13

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**



(1) LDG ELEV knob

AUTO : The pressurization system uses the FMGS data to construct an optimized pressure schedule.
To exit the AUTO position, pull out and turn the selector.

Other positions : The pressurization schedule does not use the landing elevation from the FMGS, but instead uses the landing elevation selected with this knob (from -2 000 to +14 000 ft) as its reference.

Note: *The LDG ELEV knob scale is only given as an indication; refer to the ECAM information for accurate adjustment.*

(2) MODE SEL pb

AUTO : Automatic mode is operating. One of the two systems controls the outflow valve.

MAN : This legend appears in white, and FAULT does not come on. The flight crew then uses the MAN V/S CTL selector to control the outflow valve.

Note: *Switching the MODE SEL pb to MAN, for at least 10 s, then returning it to AUTO will select the other system.*

FAULT lt : This legend appears in amber and the ECAM caution light comes on only when both automatic systems are faulty.

Note: The pilot may notice a variation in the CAB ALT indication on the ECAM PRESS page, when the system switches from the cabin pressure control AUTO mode to MAN mode, due to the reduced resolution of the backup pressure sensor.

(3) MAN V/S CTL toggle switch

The switch, springloaded to neutral controls the outflow valve position through operation of the MAN motor, when the MODE SEL pb is in the MAN position.

UP : The valve moves towards the open position.

DN : The valve moves towards the closed position.

Note: To target precise cabin vertical speed rate, only short inputs should be applied on the toggle switch.

(4) DITCHING guarded pushbutton

Normal : The system functions normally.

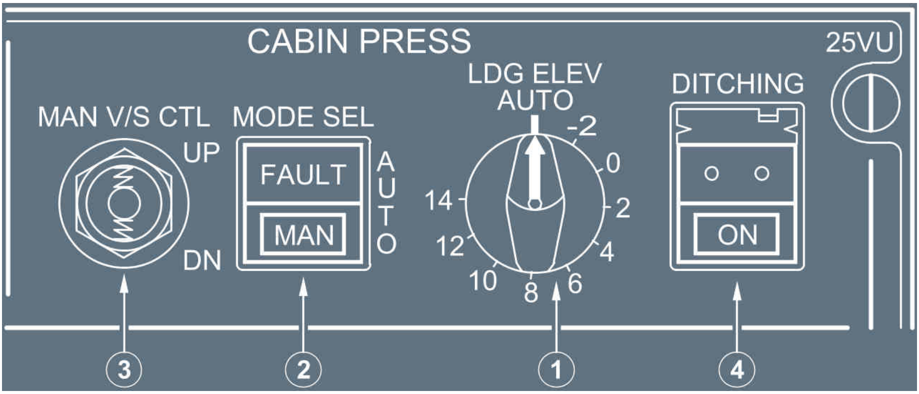
ON : The operating system sends a “close” signal to the outflow valve, emergency ram air inlet, avionics ventilation inlet and extract valves, pack flow control valves.

Note: The outflow valve will not close automatically, if it is under manual control.

CAUTION	If the ditching pb is set to ON, with the low pressure ground cart connected and all doors closed, a differential pressure will build up.

OVERHEAD PANEL

Ident.: DSC-21-20-40-00000334.0004001 / 07 MAY 13
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876



(1) LDG ELEV knob

AUTO : The pressurization system uses the FMGS data to construct an optimized pressure schedule.
To exit the AUTO position, pull out and turn the selector.

Other positions : The pressurization schedule does not use the landing elevation from the FMGS, but instead uses the landing elevation selected with this knob (from -2 000 to +14 000 ft) as its reference.

Note: *The LDG ELEV knob scale is only given as an indication; refer to the ECAM information for accurate adjustment.*

(2) MODE SEL pb

AUTO : Automatic mode is operating. One of the two systems controls the outflow valve.

MAN : This legend appears in white, and FAULT does not come on. The flight crew then uses the MAN V/S CTL selector to control the outflow valve.

Note: *Switching the MODE SEL pb to MAN, for at least 10 s, then returning it to AUTO will select the other system.*

FAULT lt : This legend appears in amber and the ECAM caution light comes on only when both automatic systems are faulty.

Note: *The pilot may notice a variation in the CAB ALT indication on the ECAM PRESS page, when the system switches from the cabin pressure control AUTO mode to MAN mode, due to the reduced resolution of the backup pressure sensor.*

(3) MAN V/S CTL selector

The switch is springloaded to neutral and controls the outflow valve position through operation of the MAN motor, when the MODE SEL pb is in the MAN position.

UP : The valve moves towards the open position.

DN : The valve moves towards the closed position.

Note: *To target precise cabin vertical speed rate, only short inputs should be applied on the selector.*

(4) DITCHING pb (guarded)

Normal : The system functions normally.

ON : The operating system sends a “close” signal to the outflow valve, emergency ram air inlet, avionics ventilation inlet and extract valves, pack flow control valves, and forward cargo isolation outlet valve.
The cargo extract fans stop automatically.

Note: *The outflow valve will not close automatically, if it is under manual control.*

CAUTION	On ground, If the ditching pushbutton is set to ON, with the low pressure ground cart connected and all doors closed, a differential pressure will build up.

LDG ELEV AUTO/MAN

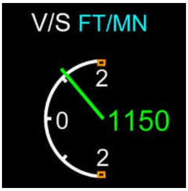
LDG ELEV AUTO	The LDG ELEV selector is in AUTO.
LDG ELEV MAN	The LDG ELEV selector is not in AUTO.

Neither appears when the indications from SDAC are not valid.

LANDING ELEVATION

500 FT	Selected either automatically by the FMGS or manually by the flight crew (but not when the MODE SEL pb-sw is in MAN).

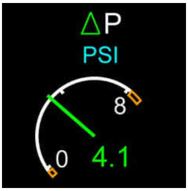
CABIN VERTICAL SPEED



Cabin vertical speed is in the normal range.

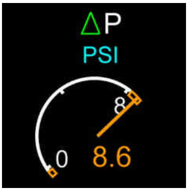
It flashes when the cabin vertical speed reaches 1 750 ft/min and stop flashing when returning below 1 650 ft/min.

ΔP INDICATION



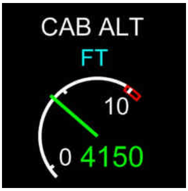
ΔP is in the normal range.

It flashes if ΔP is more than 1.5 PSI and stop flashing when returning at 1 PSI during flight phase 7. (*Refer to DSC-31-15 Flight Phases*).



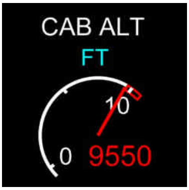
ΔP is out of normal range (≤ –0.4 PSI or ≥ 8.5 PSI).

CABIN ALTITUDE



Cabin altitude is in normal range.

It flashes when the cabin altitude reaches 8 800 ft and stop flashing when returning below 8 600 ft.



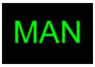
Cabin altitude is at or above 9 550 ft.

ACTIVE SYSTEM INDICATION

SYS 1 or SYS 2 is active.

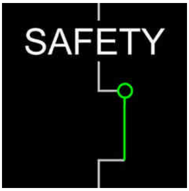
SYS 1 or SYS 2 is faulty.

When either system is inactive, its title does not appear.

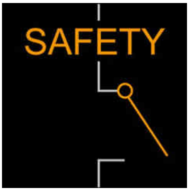


MODE SEL pb-sw is in MAN.

SAFETY VALVE POSITION



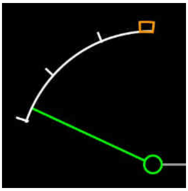
Both safety valves are fully closed.



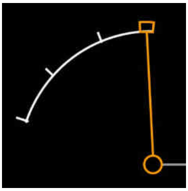
Either safety valve is open.

Note: *The safety valve opens when the indicated ΔP is between 8.9 and 9.7 PSI. The range is due to the reduced accuracy of ΔP measurements (in MAN mode), combined with the decrease in ΔP that occurs immediately after the safety valves open.*

OUTFLOW VALVE POSITION



The valve is operating normally.



In automatic mode, the valve opens more than 95 % during flight.

(1) LDG ELEV AUTO/MAN

- LDG ELEV AUTO: appears in green when the LDG ELEV selector is in AUTO.
- LDG ELEV MAN: appears in green when the LDG ELEV selector is not in AUTO.

Neither appears when the MODE SEL pushbutton switch is in MAN.

(2) Landing elevation
The landing elevation selected either automatically by the FMGS or manually by the pilot appears in green (but not when the MODE SEL pushbutton switch is in MAN).

(3) V/S FT/MIN (cabin vertical speed)
The analog and digital presentations appear in green when V/S is in the normal range.
They appear in amber when V/S ≥ 2 000 ft/min.
The digital presentation pulses when V/S > 1 800 ft/min (resets at 1 600 ft/min).

(4) ΔP PSI (cabin differential pressure)
The analog and digital presentations appear in green when ΔP is in the normal range.
They appear in amber when ΔP ≤ –0.4 PSI or ≥ 8.5 PSI.
The digital presentation pulses if Δp > 1.5 PSI (resets at 1 PSI) during flight phase 7. (*Refer to DSC-31-15 Flight Phases*).

(5) CAB ALT FT (cabin altitude)
The analog and digital presentations appear in green, in normal range.
They appear in red if the cabin altitude goes above 9 550 ft.
The digital presentation pulses if the cabin altitude is at or above 8 800 ft (resets at 8 600 ft).

(6) Active system indication (SYS 1 or SYS 2 or MAN)
SYS 1 or SYS 2 appears in green when active and in amber when faulty. When either system is inactive, its title does not appear.
MAN appears in green when the MODE SEL switch is in MAN.

(7) Safety valve position
SAFETY appears in white and the diagram in green when both safety valves are fully closed.
SAFETY and the diagram appear in amber when either valve is not closed.

Note: *The safety valve opens when the cabin differential pressure is between 8.2 and 8.9 PSI. The range is due to the reduced accuracy of ΔP measurements (in MAN mode), combined with the decrease in cabin differential pressure that occurs immediately after the safety valves open.*

(8) Outflow valve position
The diagram is green when the valve is operating normally.
The diagram becomes amber when the valve opens more than 95 % during flight.

LDG ELEV AUTO/MAN

LDG ELEV AUTO

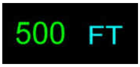
The LDG ELEV selector is in AUTO position.

LDG ELEV MAN

The LDG ELEV selector is not in AUTO position.

Neither AUTO nor MAN appears when the indications from SDAC are not valid.

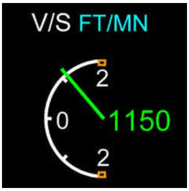
LANDING ELEVATION



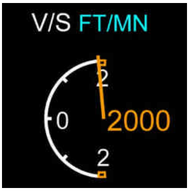
500 FT

Selected either automatically by the FMGS or manually by the flight crew (but not when the MODE SEL pb-sw is in MAN position).

CABIN VERTICAL SPEED

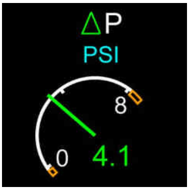


Cabin vertical speed is in the normal range.
It flashes when the cabin vertical speed reaches 1 800 ft/min and stops flashing when it decreases below 1 600 ft/min.

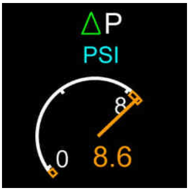


Cabin vertical speed is at or above 2 000 ft/min.

∆P INDICATION

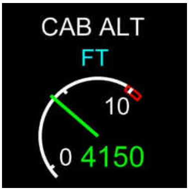


∆P is in the normal range.
It flashes if ∆P is more than 1.5 PSI and stops flashing when it decreases down to 1 PSI during flight phase 7 (*Refer to DSC-31-15 Flight Phases*).

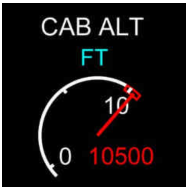


∆P is out of normal range (≤ –0.4 PSI or ≥ 8.5 PSI).

CABIN ALTITUDE



Cabin altitude is in normal range.
It flashes when the cabin altitude reaches 8 800 ft and stops flashing when it decreases below 8 600 ft.



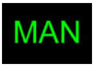
Cabin altitude is above 9 550 ft.

ACTIVE SYSTEM INDICATION

SYS 1 or SYS 2 is active.

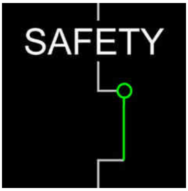
SYS 1 or SYS 2 is faulty.

When either system is inactive, its title does not appear.

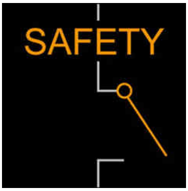


MODE SEL pb-sw is in MAN position.

SAFETY VALVE POSITION



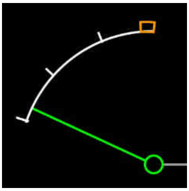
Both safety valves are fully closed.



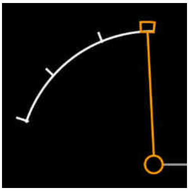
Either safety valve is open.

Note: *The safety valve opens when the indicated ∆P is between 8.2 and 8.9 PSI. The range is due to the reduced accuracy of ∆P measurements (in MAN mode), combined with the decrease in ∆P that occurs immediately after the safety valves open.*

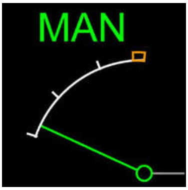
OUTFLOW VALVE POSITION



The outflow valve operates normally under automatic control.



The outflow valve has a position of more than 95 % in flight, under automatic control.



The outflow valve operates under manual control.

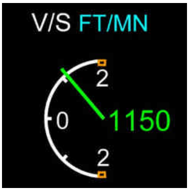
The LDG ELEV selector is not in AUTO.

Neither appears when the indications from SDAC are not valid.

LANDING ELEVATION

Selected either automatically by the FMGS or manually by the flight crew (but not when the MODE SEL pb-sw is in MAN).

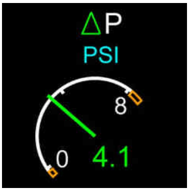
CABIN VERTICAL SPEED



Cabin vertical speed is in the normal range.

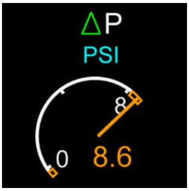
It flashes when the cabin vertical speed reaches 1 750 ft/min and stop flashing when returning below 1 650 ft/min.

∆P INDICATION



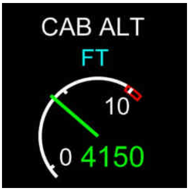
∆P is in the normal range.

It flashes if ∆P is greater than 1.5 PSI and stop flashing when returning at 1 PSI during flight phase 7. (*Refer to DSC-31-15 Flight Phases*).



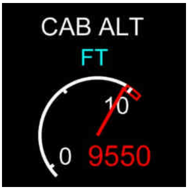
∆P is out of normal range (≤ –0.4 PSI or ≥ 8.5 PSI).

CABIN ALTITUDE



Cabin altitude is in normal range.

It flashes when the cabin altitude reaches 8 800 ft and stop flashing when returning below 8 600 ft.



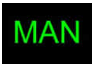
Cabin altitude is at or above 9 550 ft.

ACTIVE SYSTEM INDICATION

SYS 1 or SYS 2 is active.

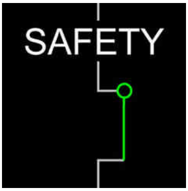
SYS 1 or SYS 2 is faulty.

When either system is inactive, its title does not appear.

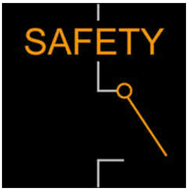


MODE SEL pb-sw is in MAN.

SAFETY VALVE POSITION



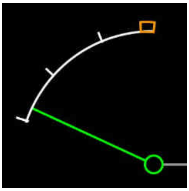
Both safety valves are fully closed.



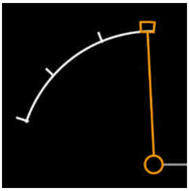
Either safety valve is open.

Note: *The safety valve opens when the indicated ΔP is between 8.9 and 9.7 PSI. The range is due to the reduced accuracy of ΔP measurements (in MAN mode), combined with the decrease in ΔP that occurs immediately after the safety valves open.*

OUTFLOW VALVE POSITION



The valve is operating normally.



The valve opens more than 95 % during flight.

Applicable to: ALL

MAN LDG ELEV : This memo appears in green, if the LDG ELEV knob is not in the AUTO position.

GENERAL

Ident.: DSC-21-30-10-00017790.0001001 / 21 MAR 16
Applicable to: ALL

The ventilation system includes ventilation for:

- The avionics, controlled by the Avionics Equipment Ventilation Controller (AEVC),
- The batteries,
- The lavatories and galleys.

Note: *For more information about cargo ventilation* ◁* , *Refer to DSC-21-40-10 General.*

Intentionally left blank

GENERAL

Ident.: DSC-21-30-20-00000341.0001001 / 24 FEB 11
Applicable to: ALL

The avionics ventilation system is fully automatic.
It cools the electrical and electronic components in the avionics compartment and on the flight deck, including the instrument and circuit breaker panels. It uses two electric fans to force the circulation of cooling air.
Whatever the configuration of the avionics ventilation system is, a part of the avionics ventilation air is sucked from the cockpit through the different cockpit panels.

MAIN COMPONENTS

Ident.: DSC-21-30-20-00017791.0001001 / 21 MAR 16
Applicable to: ALL

FANS

Two electric fans continuously circulate air around the avionics equipment, when the aircraft is electrically supplied.
The Fan Speed Controller (FSC) ◁ controls the avionics ventilation fan speed as a function of temperature::

1. High speed when the ventilation air temperature is above +40 °C (104 °F)
2. Low speed when the ventilation air temperature is below +35 °C (95 °F)

SKIN AIR INLET AND OUTLET VALVES

These valves admit air from outside the aircraft and evacuate hot air from the avionics equipment.

SKIN EXCHANGE INLET AND OUTLET BYPASS VALVES

These valves enable air to circulate between the avionics bay and the space under the cargo compartment floor.

AIR CONDITIONING INLET VALVE

This valve opens to enable the air conditioning circuit to supply fresh air to the avionics bay.

SKIN EXCHANGE ISOLATION VALVE

This valve connects or isolates the skin heat exchanger.

AVIONICS EQUIPMENT VENTILATION CONTROLLER (AEVC)

The AEVC controls the operation of all fans and valves in the avionics ventilation system.

When the BLOWER pushbutton switch is set at OVRD, the blower fan is stopped and the extract fan continues to run.
When the EXTRACT pushbutton switch is set at OVRD, the extract fan is controlled directly from the pushbutton. Both fans continue to run.

Ident.: DSC-21-30-20-A-00000347.0001001 / 09 OCT 12

SMOKE CONFIGURATION

When the smoke detector detects smoke in the avionics ventilation air the BLOWER and the EXTRACT FAULT lights come on.
When both the BLOWER and the EXTRACT pushbuttons are set to the OVRD position, the air conditioning system supplies cooling air, which is then exhausted overboard. The blower fan stops.

CONTROLLER FAILURE

In case of a controller failure, the BLOWER and the EXTRACT FAULT lights come on and both the BLOWER and the EXTRACT push-buttons are set to the OVRD position.

The controller failure configuration is the same as the SMOKE configuration concerning the blower fan, the skin exchange inlet bypass valve and the skin air outlet valve.
The skin air inlet valve, the skin exchange isolation valve and the skin exchange outlet bypass valve remain in the last position checked before the failure occurred.
The extract fan keeps running.

BATTERY VENTILATION

Ident.: DSC-21-30-40-00000350.0001001 / 21 MAR 16
Applicable to: ALL

A venturi in the skin of the aircraft draws air from the space around the batteries and vents it overboard. The resulting airflow ventilates the batteries.

Applicable to: ALL

(1) BLOWER pb-sw and EXTRACT pb-sw

AUTO: : When both pushbutton switches are on AUTO:
- On the ground before the application of TO power, the ventilation system is in open circuit configuration (closed configuration when the skin temperature is below the ground threshold).
- On the ground after the application of TO power, and in flight, the ventilation system is in closed circuit configuration.

OVRD: : When either pushbutton switch is on OVRD:
- The system goes to closed circuit configuration.
- Air from the air conditioning system is added to ventilation air. (The blower fan stops if the BLOWER pushbutton switch is in the OVRD position).

When both pushbutton switches are on OVRD:
- Air flows from the air conditioning system and then overboard.
- The extract fan continues to run.

FAULT lt: : Lights up amber (and ECAM activates)

in the blower switch, if :
- blowing pressure is low (See *)
- duct overheats (See *)
- computer power supply fails
- smoke warning is activated

in the extract switch, if :
- extract pressure is low (See *)
- computer power supply fails
- smoke warning is activated.

* If the warning occurs on the ground when the engines are stopped, the external horn sounds.

(2) *Refer to DSC-21-10-50 Controls on Overhead Panel*

(1) VENT
This normally appears in white. It becomes amber, if there is a BLOWER FAULT, EXTRACT FAULT, or AVNCS SYS FAULT.

(2) INLET and EXTRACT Indications
Normally white. The corresponding indication becomes amber, in case of a BLOWER FAULT or EXTRACT FAULT.

(3) INLET and EXTRACT Valve Diagrams

	This indicates that the valve is fully closed. It is normally green, but is amber if there is a disagreement.
	This indicates that the valve is fully open. It is normally green, but is amber if there is a disagreement. NOTE: Because of the accuracy of the temperature sensors, on the ground the closed or open indication may become amber when the temperature is close to the valve opening or closing threshold.
	This indicates that the inlet valve is in transit (inlet valve only). It is amber.
	This indicates that the outlet valve is partially open (the outlet valve is closed but a small internal flap is open).
	If the valve position is not available or the received status for the valve is inconsistent, XX appears in amber.

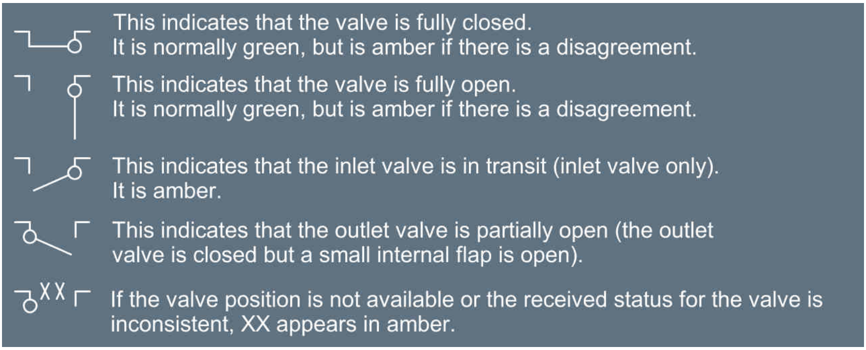
(1) BLOWER, VENT and EXTRACT Indications

VENT message normally appears in white. It becomes amber, if there is a BLOWER FAULT, EXTRACT FAULT, or AVNCS SYS FAULT.
BLOWER message appears in amber if there is a BLOWER FAULT.
EXTRACT message appears in amber if there is an EXTRACT FAULT.

(2) INLET and OUTLET Indications

Normally white. The corresponding indication becomes amber, when the inlet valve or the outlet valve is failed.

(3) INLET and OUTLET Valve Diagrams



This indicates that the valve is fully closed.
It is normally green, but is amber if there is a disagreement.

This indicates that the valve is fully open.
It is normally green, but is amber if there is a disagreement.

This indicates that the inlet valve is in transit (inlet valve only).
It is amber.

This indicates that the outlet valve is partially open (the outlet valve is closed but a small internal flap is open).

If the valve position is not available or the received status for the valve is inconsistent, XX appears in amber.

GENERAL

Ident.: DSC-21-40-10-00017795.0001001 / 21 MAR 16
Applicable to: ALL

CARGO VENTILATION ◁

An extraction fan draws air from forward cargo compartment or aft cargo compartment, and exhausts it overboard. Air from the cabin replaces the exhausted air, thus ventilating the cargo compartments.

CARGO TEMPERATURE REGULATION ◁

The system can mix hot bleed air with the air coming from the cabin, therefore giving the flight crew control of the temperature in the forward or aft cargo compartment.

FWD CARGO VENTILATION ⊲

Ident.: DSC-21-40-20-00017796.0001001 / 21 MAR 16
Applicable to: ALL

Air from the cabin goes via the inlet isolation valve to the forward cargo compartment, driven either by an extraction fan or by differential pressure in flight. A skin-mounted venturi discharges the air overboard via the outlet isolation valve. The cargo ventilation controller controls the operation of the inlet and outlet isolation valves and the extraction fan.

The ventilation system operates in two modes:
- On the ground or when $\Delta P \leq 1$ PSI in flight, the controller opens the isolation valves, then starts the extraction fan
- In flight when $\Delta P > 1$ PSI, the controller stops the fan, and differential pressure maintains the ventilation.

The controller closes the isolation valves and stops the extraction fan when:
- The flight crew sets the FWD ISOL VALVE pb-sw to OFF, or
- The forward cargo smoke detection unit detects smoke.

The outlet valve closes and the extraction fan stops when the flight crew sets the DITCHING pb-sw to ON.

AFT CARGO VENTILATION ⊲

Ident.: DSC-21-40-20-00017797.0001001 / 21 MAR 16
Applicable to: ALL

Air from the cabin goes via the inlet isolation valve to the aft cargo compartment, driven by an extraction fan. Air is controlled by the outlet isolation valve and then goes outboard through the outflow valve.
The cargo ventilation controller controls the operation of the inlet and outlet isolation valves and the extraction fan.
When the isolation valves are fully open, the extraction fan operates continuously when the aircraft is on the ground and during flight.

The controller closes the isolation valves and stops the extraction fan when:
- The flight crew sets the AFT ISOL VALVE pb-sw to OFF, or
- The aft cargo smoke detection unit detects smoke.

AFT CARGO HEATING

Ident.: DSC-21-40-20-00017798.0001001 / 21 MAR 16
Applicable to: ALL

The ventilation system for the aft cargo compartment uses hot engine bleed air (upstream of the packs), mixing it with the ambient cabin air that flows through the cargo compartment.
The cargo regulating valve regulates the pressure of this hot air supply, and the trim air valve, which is modulated electrically by the controller, controls the flow.
The cargo pressure regulating valve is pneumatically operated and electrically controlled from the HOT AIR pb on the CARGO HEAT panel.
The hot air is controlled by the cargo trim air valve which is modulated electrically by the controller.
The hot air is then mixed with air from the cabin and supplied to the cargo compartment through the ventilation inlet isolation valve.
According to the temperature selector demand, the controller regulates the amount of hot air added by the trim air valve, until the desired temperature is reached.
If the inlet temperature exceeds 70 °C, the controller closes the trim air valve.
If the inlet temperature exceeds 88 °C, the controller interprets this as a duct overheat and closes the pressure regulating valve. This valve then remains closed until the flight crew resets the system by pressing the HOT AIR pb — which it cannot do until the temperature drops below 70 °C.

FWD CARGO HEATING

Ident.: DSC-21-40-20-00017799.0001001 / 21 MAR 16
Applicable to: ALL

The ventilation system for the forward cargo compartment uses hot engine bleed air, which is also used for cockpit and cabin temperature control, mixing it with the ambient cabin air that flows through the cargo compartment.
The cockpit and cabin hot air pressure regulating valve regulates the pressure of this hot air supply, and the cargo trim air valve, which is modulated electrically by the controller, controls the flow.
The hot air mixes with air from the cabin as it supplied to the cargo compartment through the ventilation inlet isolation valve.
The controller regulates the amount of hot air added by the trim air valve to get the desired temperature, per the temperature selector.
If the inlet temperature exceeds 70 °C, the controller closes the trim air valve. If the inlet temperature reaches 88 °C, the controller interprets this as a duct overhead and closes the pressure regulating valve. This valve then remains closed until the flight crew resets the system by pressing the HOT AIR pb - which it cannot do until the temperature drops below 70 °C.

OVERHEAD PANEL

OFF : The inlet and outlet isolation valves and the trim air valve close, the extraction fan stops.

FAULT lt : The light, associated with the ECAM caution, comes on amber when either inlet or outlet valve is not in the selected position.

(2) FWD temperature selector ❄

- COLD position : Approximately 5 °C (41 °F)
- HOT position : Approximately 26 °C (79 °F)
- Middle position : Approximately 15 °C (59 °F).

Note: The cargo compartment temperature may vary, depending on external factors (flight duration, outside temperature...).

(3) AFT ISOL VALVE pb-sw ❄

The switch controls the isolation valves and the extraction fan.

Auto : The inlet and outlet isolation valves open, extraction fan runs if there is no smoke detected in the aft cargo bay.

OFF : The inlet and outlet isolation valves and the trim air valve close, the extraction fan stops.

FAULT lt : The light, associated with the ECAM caution, comes on amber when either inlet or outlet valve is not in the selected position.

(4) HOT AIR pb ❄

Auto : The pressure regulating valve regulates the hot air pressure.

OFF : The pressure regulating valves and the trim air valve close. The fault circuit is reset.

FAULT lt : The amber light and ECAM caution come on, when a duct overheat is detected 88 °C (190 °F).
The light goes out, when the temperature drops below 70 °C (158 °F), and OFF is selected. Then, if the pushbutton is set to on, the system resets.

(5) AFT temperature selector ❄

- COLD position : Approximately 5 °C (41 °F)
- HOT position : Approximately 26 °C (79 °F)
- Middle position : Approximately 15 °C (59 °F).

Note: 1. *The cargo compartment temperature may vary, depending on external factors (flight duration, outside temperature...).*
2. *The actual bulk cargo compartment temperature may be 10 °C (18 °F) lower than the selected temperature.*

PREAMBLE

Ident.: DSC-22_10-10-00010067.0001001 / 17 AUG 10

Applicable to: ALL

This section gives a general description of the Auto Flight System and its functions:

- Architecture
- Function description
- Basic principle of systems:
  - Reversion
  - Protection
  - Managed and selected guidance modes.
- Mode information
- Display characteristics
- Operational principles
- Flight crew interface (MCDU pages)
- Degraded modes of operations.

DESCRIPTION

Ident.: DSC-22_10-10-00010068.0001001 / 17 AUG 10

Applicable to: ALL

The Flight Management Guidance System (FMGS) contains the following units:

- Two Flight Management Guidance Computers (FMGC)
- Two Multipurpose Control and Display Units (MCDU) (third MCDU optional)
- One Flight Control Unit (FCU)
- Two Flight Augmentation Computers (FAC).

GENERAL PHILOSOPHY

Ident.: DSC-22_10-10-00010069.0001001 / 17 AUG 10

Applicable to: ALL

The Flight Management and Guidance System (FMGS) provides predictions of flight time, mileage, speed, economy profiles and altitude.
It reduces cockpit workload, improves efficiency, and eliminates many routine operations generally performed by the flight crew.

The Flight Management Guidance System (FMGS) operates as follows:
- During cockpit preparation the flight crew uses the Multipurpose Control and Display Unit (MCDU) to insert a preplanned route from origin to destination. This route includes SID, EN ROUTE, WAYPOINTS, STAR, APPROACH, MISSED APPR, and ALTN route as available from the navigation database.
- Subsequently the system defines a vertical profile and a speed profile, taking into account ATC requirements and performance criteria.

Either FMGC performs all operations, if one FMGC fails.
The FMGS computes the aircraft position continually, using stored aircraft performance data and navigation data. Therefore it can steer the aircraft along a preplanned route and vertical and speed profiles. This type of guidance is said to be “managed”.
If the flight crew wants to modify any flight parameter (SPD, V/S, HDG, etc.) temporarily, they may do so by using the various Flight Control Unit (FCU) selectors. The FMGS then guides the aircraft to the target value of this parameter that they have selected. This type of guidance is said to be “selected”.

The two available types of guidance, then, are:
- Managed guidance guides the aircraft along the preplanned route and the vertical and speed/Mach profile. (The FMGS computes the target values of the various flight parameters).
- Selected guidance guides the aircraft to the target values of the various flight parameters the flight crew selects by using the FCU selectors.

Selected guidance always has priority over managed guidance.

FLIGHT MANAGEMENT GUIDANCE COMPUTER (FMGC)

Ident.: DSC-22_10-10-00010073.0005001 / 04 SEP 18

7 **Applicable to: MSN 10949-11597**

Each FMGC is divided into two main parts:
- The Flight Management (FM) part controls the following functions:
  - Navigation and management of navigation radios
  - Management of flight planning
  - Prediction and optimization of performance
  - Display management.
- The Flight Guidance (FG) part performs the following functions:
  - Autopilot (AP) command
  - Flight Director (FD) command
  - Autothrust (A/THR) command.

Each FMGC has its own set of databases. The individual databases can be independently loaded into their respective FMGC, or independently copied from one FMGC to the other.

Each FMGC contains these main databases:

1. The Navigation database contains standard navigation data: Navaids, waypoints, airways, enroute information, holding patterns, airports, runways, procedures (SIDs, STARs, etc.), company routes, alternates.
   The airline updates this part every 28 days, and is responsible for defining, acquiring, updating, loading, and using this data. The updating operation takes 20 min to complete or 5 min if cross loaded from the opposite FMGC.
2. The Airline Modifiable Information (AMI), also described as the FM Airline Configuration file, contains:
   - Airline policy values: THR RED altitude, ACC altitude, EO ACC altitude, PERF factor, IDLE factor.
   - Fuel policy values: Fuel for taxi, % of route reserve, maximum and minimum values of route reserve, etc.
   - AOC functions customization.
3. The Aircraft Performance database includes the Engine model, Aerodynamical model, and Performance model. The airline cannot modify this database.
4. The Magnetic Variation database.
5. Each FMGC contains elements stored by the flight crew that enable them to create 99 waypoints, 10 runways, 20 navaids, and 5 routes.

FLIGHT MANAGEMENT GUIDANCE COMPUTER (FMGC)

Ident.: DSC-22_10-10-00010073.0002001 / 28 MAY 20

   - AOC functions customization.
3. The Aircraft Performance database includes the Engine model, Aerodynamical model, and Performance model. The airline cannot modify this database.
4. The Magnetic Variation database.
5. Each FMGC contains elements stored by the flight crew that enable them to create 20 waypoints, 10 runways, 20 navaids, and 5 routes.

FLIGHT MANAGEMENT GUIDANCE COMPUTER (FMGC)

Ident.: DSC-22_10-10-00010073.0004001 / 28 MAY 20
Applicable to: MSN 04827-04860

Each FMGC is divided into two main parts:

- The Flight Management (FM) part controls the following functions:
  - Navigation and management of navigation radios
  - Management of flight planning
  - Prediction and optimization of performance
  - Display management.
- The Flight Guidance (FG) part performs the following functions:
  - Autopilot (AP) command
  - Flight Director (FD) command
  - Autothrust (A/THR) command.

Each FMGC has its own set of databases. The individual databases can be independently loaded into their respective FMGC, or independently copied from one FMGC to the other.

Each FMGC contains these main databases:

1. The Navigation database contains standard navigation data: Navaids, waypoints, airways, enroute information, holding patterns, airports, runways, procedures (SIDs, STARs, etc.), company routes, alternates.
   The airline updates this part every 28 days, and is responsible for defining, acquiring, updating, loading, and using this data. The updating operation takes 20 min to complete or 5 min if cross loaded from the opposite FMGC.
2. The Airline Modifiable Information (AMI), also described as the FM Airline Configuration file, contains:
   - Airline policy values: THR RED altitude, ACC altitude, EO ACC altitude, PERF factor, IDLE factor.
   - Fuel policy values: Fuel for taxi, % of route reserve, maximum and minimum values of route reserve, etc.
   - AOC functions customization.
3. The Aircraft Performance database includes the Engine model, Aerodynamical model, and Performance model. The airline cannot modify this database.
4. The Magnetic Variation database.
5. Each FMGC contains elements stored by the flight crew that enable them to create 20 waypoints, 10 runways, 20 navaids, and 5 routes.

MULTIPURPOSE CONTROL AND DISPLAY UNIT (MCDU)

Ident.: DSC-22_10-10-00010074.0001001 / 17 AUG 10
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

Two MCDUs are installed on the pedestal for flight crew loading and display of data. The use of the MCDU allows the flight crew to interface with the FMGC by selection of a flight plan for lateral and vertical trajectories and speed profiles. The flight crew may also modify selected navigation or performance data and specific functions of Flight Management (revised flight plan, engine-out, secondary flight plan, etc.). Additional data from peripherals (Centralized Fault Display System (CFDS), ARINC Communication Addressing and Reporting System (ACARS), Air Traffic Service Unit (ATSU)...) can also be displayed. Data that is entered into the MCDU that is illogical or beyond the aircraft capabilities will either be disregarded or will generate an advisory message.

MULTIPURPOSE CONTROL AND DISPLAY UNIT (MCDU)

Ident.: DSC-22_10-10-00010074.0002001 / 17 AUG 10
8 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Two MCDUs are installed on the pedestal for flight crew loading and display of data. The use of the MCDU allows the flight crew to interface with the FMGC by selection of a flight plan for lateral and vertical trajectories and speed profiles. The flight crew may also modify selected navigation

or performance data and specific functions of Flight Management (revised flight plan, engine-out, secondary flight plan, etc.). Additional data from peripherals (Centralized Fault Display System (CFDS), ARINC Communication Addressing and Reporting System (ACARS), Air Traffic Service Unit (ATSU)...) can also be displayed. Data that is entered into the MCDU that is illogical or beyond the aircraft capabilities will either be disregarded or will generate an advisory message.
The MCDUs allow the activation of the back–up navigation in the case of a dual FM Failure.

FLIGHT CONTROL UNIT (FCU)

Ident.: DSC-22_10-10-00010075.0001001 / 17 AUG 10
Applicable to: ALL

The FCU located on the glareshield, is the short-term interface between the flight crew and the FMGC. It is used to select any flight parameters or modify those selected in the MCDU. The autopilots and autothrust functions may be engaged or disengaged. Different guidance modes can be selected to change various targets (speed, heading, track, altitude, flight path angle, vertical speed).

FLIGHT AUGMENTATION COMPUTER (FAC)

Ident.: DSC-22_10-10-00010076.0001001 / 17 AUG 10
Applicable to: ALL

The FAC controls rudder, rudder trim and yaw damper inputs. It computes data for the flight envelope and speed functions. The FAC also provides warning for low-energy and windshear detection if these functions are installed.

OTHER FLIGHT CREW INTERFACES

Applicable to: ALL

Ident.: DSC-22_10-10-A-00010077.0001001 / 23 JUN 15

THRUST LEVERS

The thrust levers are the main interface between the Flight Management Guidance Computer (FMGC), the Full Authority Digital Engine Control System (FADEC), and the flight crew.

The thrust levers:
- Arm the autothrust at takeoff, when FLX or TOGA is selected
- Limit the maximum thrust by their position when autothrust is active
- Disconnect the autothrust system when the flight crew sets them to IDLE
- Command the thrust manually when autothrust is not active
- Engage the common modes (takeoff or go-around) when TOGA (or FLX for takeoff) is set
- Set the autothrust to the active mode when they are between IDLE and CL detent (MCT in engine out).

Ident.: DSC-22_10-10-A-00010078.0001001 / 17 AUG 10

ELECTRONIC FLIGHT INSTRUMENTS (EFIS)

Two Primary Flight Displays (PFD) and Navigation Displays (ND) provide the flight crew with full-time flight guidance, navigation and system advisory information for all flight phases. An EFIS control panel is located at each end of the glareshield and is used to control both Primary and Navigation Displays. This panel includes controls to select various modes within the PFD. A selector allows the barometric altimeter setting to be displayed on the PFD. Various distance ranges can be selected on the ND, and two switches allow either the left or right VOR/ADF bearing pointers to be displayed on the ND.

Ident.: DSC-22_10-10-A-00010079.0001001 / 17 AUG 10

PRIMARY FLIGHT DISPLAYS

The PFDs combine several conventional flight instrument indications on one color display panel, for centralized reference of flight data.

This centralized color display includes:
- Flight Director attitude guidance targets
- Armed and engaged modes
- Navigation and instrument approach information
- Altimeter setting
- Barometric altitude
- System messages.

Ident.: DSC-22_10-10-A-00010080.0002001 / 17 AUG 10

NAVIGATION DISPLAYS

Five different color navigation compass displays can be selected:
- ARC (map mode)
- ROSE NAV (map mode)
- ROSE VOR
- ROSE LS
- PLAN.

Information displayed on these modes uses the aircraft’s position as a reference point for the flight plan navigation data (lateral and vertical information).

GENERAL

Ident.: DSC-22_10-30-00010085.0001001 / 17 AUG 10
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

The FMGS has three modes of operation:
- Dual mode (the normal mode)
- Independent mode. Each FMGC being controlled by its associated MCDU
- Single mode (using one FMGC only).

GENERAL

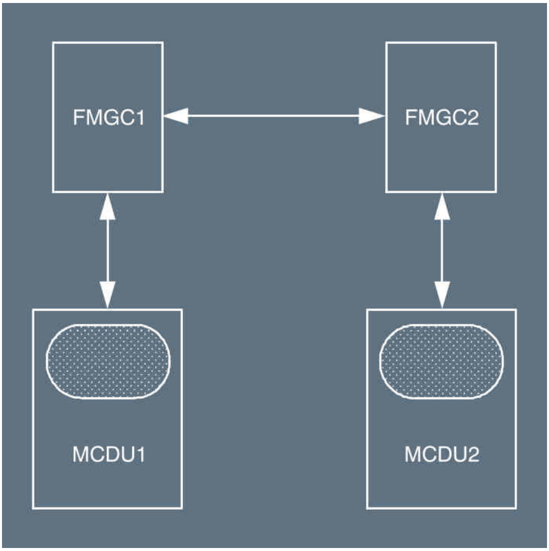
Ident.: DSC-22_10-30-00010085.0002001 / 17 AUG 10
1 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The FMGS has four modes of operation:
- Dual mode (the normal mode)
- Independent mode. Each FMGC being controlled by its associated MCDU
- Single mode (using one FMGC only)
- Back–up navigation mode.

DUAL MODE

Ident.: DSC-22_10-30-00010086.0001001 / 01 OCT 12
Applicable to: ALL

This is the normal mode. The two FMGCs are synchronized: each performs its own computations and exchanges data with the other through a crosstalk bus.
One FMGC is the master, the other the slave, so that some data in the slave FMGC comes from the master.
All data inserted into any MCDU is transferred to both FMGCs and to all peripherals.



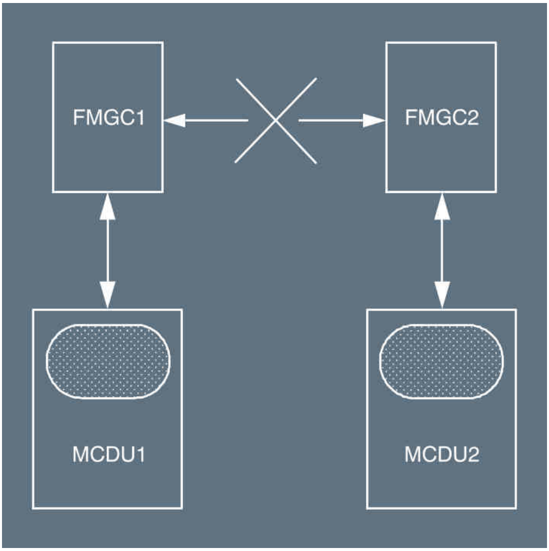
MASTER FMGC LOGIC

- If one autopilot (AP) is engaged, the related FMGC is master:
  - It uses the onside FD for guidance
  - It controls the A/THR
  - It controls the FMA 1 and 2.
- If two APs are engaged, FMGC1 is master.
- If no AP is engaged, and
  - The FD1 pb is on, then FMGC1 is master
  - The FD1 pb is off, and FD2 pb on then FMGC2 is master.
- If no AP/FD is engaged, A/THR is controlled by FMGC1.

INDEPENDENT MODE

Ident.: DSC-22_10-30-00010087.0001001 / 01 OCT 12

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**



The system automatically selects this degraded mode under specific abnormal conditions (e.g. different database validity on both FMGCs).
Both FMGCs work independently and are linked only to peripherals on their own sides of the flight deck ("onside" peripherals).
When this occurs, the "INDEPENDENT OPERATION" message is displayed on both MCDU scratchpads.
Each MCDU transmits data it receives from its onside FMGC. It affects only the onside EFIS (Electronic Flight Instrument System) and RMP (Radio Management Panel).
On the POS MONITOR page (and GPS MONITOR page ◁), FMGS position (and GPS position ◁) from the opposite FMGC is not displayed.
On the RAD NAV page (and PROG page, if the FMGS GPS is not installed), navaids tuned on the opposite MCDU are not displayed. Corresponding fields are blank.

PROCEDURES ON GROUND

- **If each FMGC is loaded with a different database,** the FMGS will only operate in independent mode.

CHECK the database number and validity.

CROSSLOAD ◁ the database to restore the dual operation.

Crossload function is available on ground only (in preflight or done phase), when an independent operation is detected.

PROCEDURES IN FLIGHT

DO NOT SWITCH the navigation databases.
MAKE the same entries on both MCDUs to have both AP/FDs similar orders.

Both FGs being valid, 2 APs may be engaged for CAT II or CAT III operations.

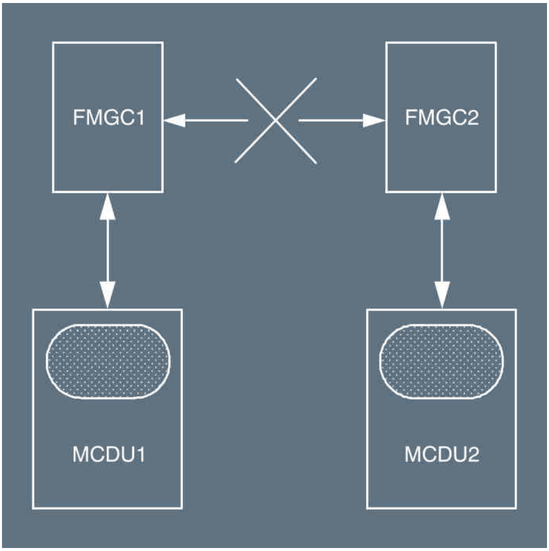
- **In the event of a go-around and when the second AP is disconnected:**

  ENSURE that the FMGC in command has correct flight plan orders and an updated nav database.

  Airbus does not recommend pulling one FMGC circuit breaker to force the system to operate in SINGLE mode.

INDEPENDENT MODE

Ident.: DSC-22_10-30-00010087.0002001 / 01 OCT 12
Applicable to: MSN 04827-04860



The system automatically selects this degraded mode under specific abnormal conditions (e.g. different database validity on both FMGCs).

Both FMGCs work independently and are linked only to peripherals on their own sides of the flight deck ("onside" peripherals).
When this occurs, the "INDEPENDENT OPERATION" message is displayed on both MCDU scratchpads. "IND" annunciator on top of the MCDU is lit.
Each MCDU transmits data it receives from its onside FMGC. It affects only the onside EFIS (Electronic Flight Instrument System) and RMP (Radio Management Panel).
On the POS MONITOR page (and GPS MONITOR page ◁✱), FMGS position (and GPS position ◁✱) from the opposite FMGC is not displayed.
On the RAD NAV page, navaids tuned on the opposite MCDU are not displayed. Corresponding fields are blank.

PROCEDURES ON GROUND

- **If each FMGC is loaded with a different database,** the FMGS will only operate in independent mode.

  CHECK the database number and validity.

  CROSSLOAD the database to restore the dual operation.

  Crossload function is available on ground only (in preflight or done phase), when an independent operation is detected.

PROCEDURES IN FLIGHT

DO NOT SWITCH the navigation databases.
MAKE the same entries on both MCDUs to have both AP/FDs similar orders.

Both FGs being valid, 2 APs may be engaged for CAT II or CAT III operations.

- **In the event of a go-around and when the second AP is disconnected:**

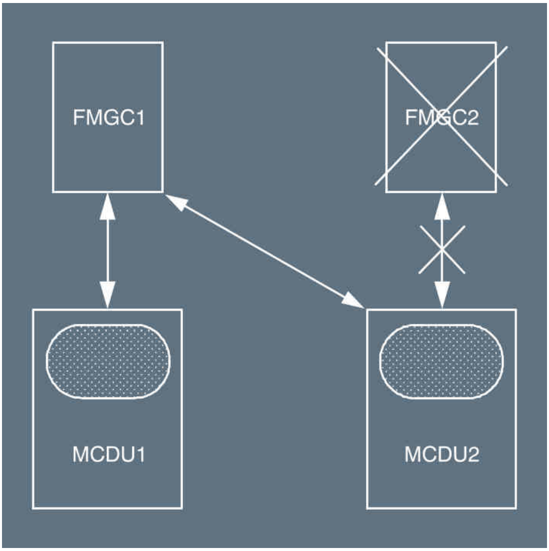
  ENSURE that the FMGC in command has correct flight plan orders and an updated nav database.

  Airbus does not recommend pulling one FMGC circuit breaker to force the system to operate in SINGLE mode.

SINGLE MODE

Ident.: DSC-22_10-30-00010088.0001001 / 01 OCT 12

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321



The system automatically selects this degraded mode when one FMGC fails.
When this occurs, the failed FMGC displays “OPP FMGC IN PROCESS” in white on the MCDU scratchpad.
The corresponding ND displays the “SELECT OFFSIDE RNG/MODE” amber message.
Both POS MONITOR pages display the same position (operative FMGC position).
Both FDs are driven by the same FMGC. Any entry on either MCDU is sent to the operative FMGC.

PROCEDURES

- **If a transient failure triggers a single mode of operation:**

  DO NOT USE the MCDU(s) until the PLEASE WAIT message is suppressed.

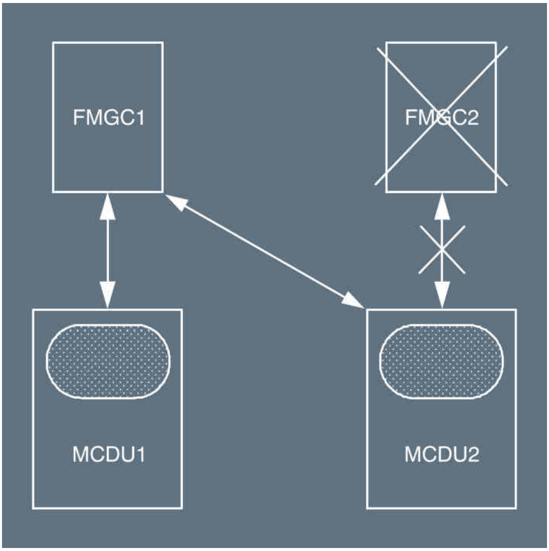
  SET both NDs on the same range and mode to display the same information from the operative FMGC.

  When convenient, RESET the failed FMGC. (*Refer to DSC-22_20-90-10 Manual FMGC Reset - General*).

SINGLE MODE

Ident.: DSC-22_10-30-00010088.0004001 / 01 OCT 12

3 **Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**



The system automatically selects this degraded mode when one FMGC fails.
When this occurs, the failed FMGC displays “OPP FMGC IN PROCESS” in white on the MCDU scratchpad.

On the ND usually associated with the failed FM:
- If the NDs are not both in the same mode or range, the associated ND displays "MAP NOT AVAIL" and "SET OFFSIDE RNG/MODE".
- If the NDs are in the same mode and range, the associated ND displays the "OFFSIDE FM CONTROL" amber message.

Both POS MONITOR pages display the same position (operative FMGC position).
Both FDs are driven by the same FMGC. Any entry on either MCDU is sent to the operative FMGC.

PROCEDURES

- **If a transient failure triggers a single mode of operation:**

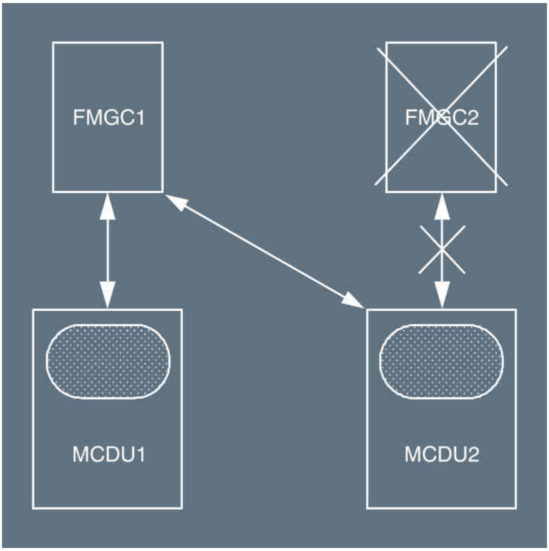
  DO NOT USE the MCDU(s) until the PLEASE WAIT message is suppressed.

  SET both NDs on the same range and mode to display the same information from the operative FMGC.

When convenient, RESET the failed FMGC. (*Refer to DSC-22_20-90-10 Manual FMGC Reset - General*).

SINGLE MODE

Ident.: DSC-22_10-30-00010088.0016001 / 01 OCT 12
Applicable to: MSN 04827-04860



The system automatically selects this degraded mode when one FMGC fails.
When this occurs, the MCDU on the side of the failed FMGC reverts to MCDU MENU page, and a prompt to connect the MCDU on the opposite FMGC is displayed. When this prompt is pressed, the "OPP FMGC IN PROCESS" message is displayed in white on the MCDU scratchpad.

On the ND usually associated with the failed FM:
- If the NDs are not both in the same mode or range, the associated ND displays "MAP NOT AVAIL" and "SET OFFSIDE RNG/MODE".
- If the NDs are in the same mode and range, the associated ND displays the "OFFSIDE FM CONTROL" amber message.

Both POS MONITOR pages display the same position (operative FMGC position).
Both FDs are driven by the same FMGC. Any entry on either MCDU is sent to the operative FMGC.

PROCEDURES

- **If a transient failure triggers a single mode of operation:**

  DO NOT USE the MCDU(s) until the PLEASE WAIT message is suppressed.

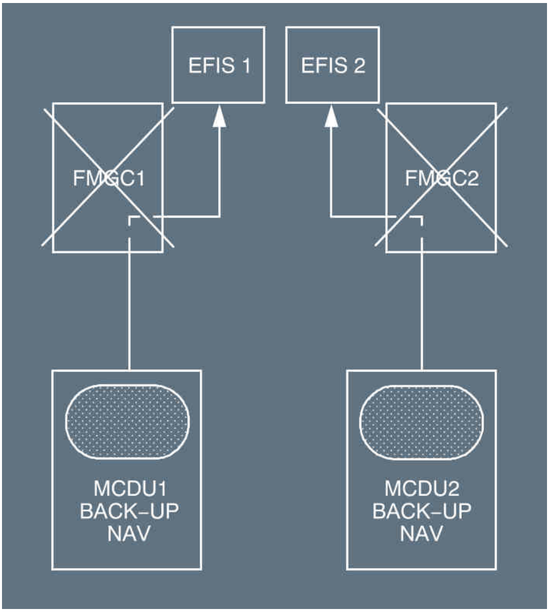
  SET both NDs on the same range and mode to display the same information from the operative FMGC.

  When convenient, RESET the failed FMGC. (*Refer to DSC-22_20-90-10 Manual FMGC Reset - General*).

BACK UP NAVIGATION MODE

Ident.: DSC-22_10-30-00010089.0001001 / 01 OCT 12

4 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**



The flight crew selects on the MCDU MENU page this degraded mode when both FMGCs fail. They recover the navigation function through the MCDU and IRS/GPS ◁ .
The MCDU continuously memorizes the active flight plan in its memory.

If both FMGCs fail, the back up navigation provides the following functions:
- Flight Planning
- Aircraft position using onside IRS, IRS3, or GPIRS position (if GPS ◁)

- F-PLN display on ND
- No AP/FD NAV mode
- Limited lateral revision
- F-PLN automatic sequencing.

GENERAL

Ident.: DSC-22_10-40-05-00010083.0001001 / 17 AUG 10

Applicable to: ALL

The flight management system displays navigation, performance and guidance information on the:

- Multipurpose Control and Display Unit (MCDU)
- Navigation Display (ND) of the Electronic Flight Instrument System (EFIS)
- Primary Flight Display (PFD) of the EFIS.

Intentionally left blank

MCDU

GENERAL

The Multipurpose Control and Display Unit (MCDU) is a cathode ray tube that generates 14 lines of 24 characters each, including:

- A title line that gives the name of the current page in large letters
- Six label lines, each of which names the data displayed just below it (on the data field line)
- Six data field lines that display computed data or data inserted by the flight crew
- The scratchpad line that displays:
  - Specific messages
  - Information the flight crew has entered by means of the number and letter keys and which can then be moved to one of the data fields.

GENERAL

The Multipurpose Control and Display Unit (MCDU) has a Liquid Crystal Display (LCD) with 14 lines of 24 characters each, including:

- A title line that gives the name of the current page in large letters
- Six label lines, each of which names the data displayed just below it (on the data field line)
- Six data field lines that display computed data or data inserted by the flight crew
- The scratchpad line that displays:
  - Specific messages
  - Information the flight crew has entered by means of the number and letter keys and which can then be moved to one of the data fields.

Ident.: DSC-22_10-40-10-A-00010092.0001001 / 17 AUG 10
Applicable to: ALL

LINE SELECT KEYS

There is a column of Line Select Keys (LSKs) on each side of the screen.

The flight crew uses these keys to:

- Move a parameter they have entered in the scratchpad to the appropriate line on the main screen
- Call up a specific function page indicated by a prompt displayed on the adjacent line
- Call up lateral or vertical revision pages from the flight plan page.

Ident.: DSC-22_10-40-10-A-00010093.0001001 / 17 AUG 10
Applicable to: MSN 01459, 02014

KEYBOARD

The keyboard includes:

- Function and Page keys

Function and Page keys	Call up functions and pages the flight crew uses for flight management functions and computations.
↑ ↓ (or SLEW) keys	Move a page up or down to display portions that are off the screen.
NEXT PAGE key	Moves to the next page of a multi-page element. An arrow in the top right corner indicates that another page is available.
AIRPORT key	Calls up the flight plan page that contains the next airport along the current flight plan. Successive pushes on the key show the alternate airport, the origin airport (before takeoff), and the next airport again.

- Number and letter keys allow the flight crew to insert data in the scratchpad so that they can use a line select key to enter it in the main display.
- Two keys have special functions:

CLR (clear) key	Erases material (messages or inserted data) from the scratchpad or from certain areas of displayed pages.
OVFY (overfly) key	Allows the aircraft to overfly a selected waypoint.

Ident.: DSC-22_10-40-10-A-00010093.0002001 / 17 AUG 10

KEYBOARD

The keyboard includes:

- Function and Page keys

Function and Page keys	Call up functions and pages the flight crew uses for flight management functions and computations.
↑ ↓ (or SLEW) keys	Move a page up or down to display portions that are off the screen.
← → keys	Moves to the next page of a multi-page element. An arrow in the top right corner indicates that another page is available.
AIRPORT key	Calls up the flight plan page that contains the next airport along the current flight plan. Successive pushes on the key show the alternate airport, the origin airport (before takeoff), and the next airport again.

- Number and letter keys allow the flight crew to insert data in the scratchpad so that they can use a line select key to enter it in the main display.
- Three keys have special functions:

CLR (clear) key	Erases material (messages or inserted data) from the scratchpad or from certain areas of displayed pages.
OVFY (overfly) key	Allows the aircraft to overfly a selected waypoint.
SP (space) key	Allows to insert a space in specific message.

Ident.: DSC-22_10-40-10-A-00010094.0001001 / 17 AUG 10
Applicable to: MSN 01459, 02014

ANNUNCIATORS (ON THE SIDE OF THE KEYBOARD)

FAIL (amber)	Indicates that the Multipurpose Control and Display Unit (MCDU) has failed.
MCDU MENU (white)	Indicates that the flight crew should call up a peripheral linked to the MCDU (such as ACARS, ATSU or CFDS).
FMGC (white)	Comes on while the flight crew is using the MCDU to display peripherals. This light tells the flight crew that the FMGC has an important message to deliver. The flight crew accesses the message by pressing the MCDU MENU key and the line select key adjacent to the FMGC prompt.

Ident.: DSC-22_10-40-10-A-00010094.0002001 / 17 AUG 10

BRT AND DIM KEYS

Control the light intensity of the entire MCDU. MCDU power up is performed with the BRT key and MCDU shut down is performed with the DIM key.

Ident.: DSC-22_10-40-10-A-00010095.0001001 / 17 AUG 10

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03002-03032

BRT knob

Controls the light intensity of the entire MCDU.

Ident.: DSC-22_10-40-10-A-00010097.0001001 / 17 AUG 10

Applicable to: ALL

DATA ENTRY

The flight crew enters data by typing it into the scratchpad on the MCDU. Next, pressing the line select key (LSK) will load the data from the scratchpad into the desired field. An error message displays if the data is out of range or not formatted correctly. To correct data, the flight crew may clear the message with the clear (CLR) key and then retype the message into the scratchpad. Pressing the CLR key when the scratchpad is empty displays “CLR”. To clear data from a field, select CLR from the scratchpad to the data field to be cleared.

Ident.: DSC-22_10-40-10-A-00010098.0001001 / 17 AUG 10

Applicable to: ALL

MCDU ENTRY FORMAT

The flight crew enters information into the MCDU at the bottom line of the scratchpad. When data has lead zeros, they may be omitted if desired. For example a three-digit wind direction of 060 may be typed as 60. The display will still show 060. To enter an altitude below 1 000 ft, the lead zero must be added as 0400 for 400 ft. This differentiates the altitude from a flight level.
To enter a double data entry such a speed/altitude, the separating slash must be used. If entering only the first part of a double entry, omit the slash. To enter only the second part of a double entry, a leading slash must be used i.e. /0400.

Ident.: DSC-22_10-40-10-A-00010099.0001001 / 17 AUG 10
Applicable to: ALL

MESSAGES

The scratchpad displays various messages for flight crew information. Theses messages are prioritized by importance to the flight crew as either amber or white.

Amber messages are:
- Navigation messages
- Data entry messages
- EFIS repeat messages.

Amber messages are categorized into two types:
- Type 1 message that is a direct result of a flight crew action. Type 1 messages are displayed immediately in the scratchpad ahead of other messages.
- Type 2 messages inform the flight crew of a given situation or request a specific action. Stored in “last in”, “first out” message queue that holds maximum of 5 messages.
  Type 2 messages are displayed in the scratchpad only if there are no Type 1 messages or other data and will remain until all the messages have been viewed and cleared with the CLR key.

White messages are advisory only.

Ident.: DSC-22_10-40-10-A-00010101.0001001 / 17 AUG 10
Applicable to: ALL

CHARACTERS

Small and large fonts are displayed according to the following rules:
- The title line and the scratchpad are displayed in large font
- Datafields are usually displayed in large font
- Label lines are displayed in small font
- Flight crew entries and modifiable data are displayed in large font
- Defaulted/computed and non modifiable data are displayed in small font.

MCDU FUNCTION KEYS

The function keys on the Multipurpose Control and Display Units allow the flight crew to call up MCDU pages quickly.
The following is a summary of the purpose of each key:

DIR	Calls up the DIR TO page, and enables the flight crew to proceed directly from the present position to any waypoint, entered manually or selected in the active flight plan.
PROG	Calls up the progress page corresponding to the phase of the active flight plan that is in progress. This page displays navigation information and active data such as the optimum and maximum recommended cruise flight levels. It enables the flight crew to update the FMGS position and to obtain a bearing and distance to any location.

PERF	Calls up the performance pages, that display the optimum speed or Mach number for each phase. The flight crew can amend these pages. The first page to be displayed is the one corresponding to the current flight phase (except for preflight and done phases). The flight crew can then use the appropriate 6L or 6R LSK to call up pages corresponding to future flight phases.
INIT	Calls up the flight plan initialization A page, which also gives the flight crew access to the B page. The flight crew uses the INIT pages to initialize Flight Management for the flight. The flight crew uses the INIT A page primarily to insert his flight plan and to align the inertial reference system. The flight crew uses the INIT B page to insert aircraft weight, fuel on board, CG and various fuel requirements. The FMGS uses this data to compute predictions and fuel planning parameters. The flight crew has access to the INIT A page only in the preflight phase. INIT B page (not accessible after engine start) is called up by pressing the "NEXT PAGE" key.
DATA	Calls up the data index page. This gives the flight crew access to various reference pages that show aircraft position, aircraft status, runways, waypoints, navaids, routes, and data stored by the flight crew.
F-PLN	Calls up the flight plan A and B pages, which contain a leg-by-leg description of the active primary flight plan. The flight crew can use the slewing keys to review the entire active flight plan. They can make all lateral and vertical revisions to the flight plan through these pages, using the left LSKs for lateral revision and the right keys for vertical revision.
RAD NAV	Calls up the radio navigation page. This page displays the Radio Navaids tuned automatically or manually through the FMGC.
FUEL PRED	Calls up the fuel prediction page. Once the engines are started, this page displays the fuel predicted to be remaining at the destination and the alternate, as well as fuel management data.
SEC F-PLN	Calls up the index page for the secondary flight plan. The flight crew can use this page to call up the secondary flight plan and all the functions related to it (copying, deleting, reviewing, activating, and the INIT and PERF pages).
ATC COMM	Calls up the ATC applications (not activated).

MCDU MENU	Calls up the MCDU MENU page, which displays the subsystems currently addressed via the MCDU. The key next to the name of a subsystem enables the flight crew to select that subsystem. When the MCDU MENU annunciator lights up, the flight crew should press the MCDU MENU key. The menu will have [REQ] displayed next to the name of the subsystem that requires attention.

MCDU FUNCTION KEYS

The function keys on the Multipurpose Control and Display Units allow the flight crew to call up MCDU pages quickly.
The following is a summary of the purpose of each key:

DIR	Calls up the DIR TO page, and enables the flight crew to proceed directly from the present position to any waypoint, entered manually or selected in the active flight plan.
PROG	Calls up the progress page corresponding to the phase of the active flight plan that is in progress. This page displays navigation information and active data such as the optimum and maximum recommended cruise flight levels. It enables the flight crew to update the FMGS position and to obtain a bearing and distance to any location.
PERF	Calls up the performance pages, that display the optimum speed or Mach number for each phase. The flight crew can amend these pages. The first page to be displayed is the one corresponding to the current flight phase (except for preflight and done phases). The flight crew can then use the appropriate 6L or 6R LSK to call up pages corresponding to future flight phases.

INIT	Calls up the flight plan initialization (INIT) A page, that also gives access to the INIT B page and the IRS INIT page. The flight crew uses the INIT pages to initialize the Flight Management System for the flight. The flight crew uses the INIT A page to initialize the flight plan, set the departure and arrival airports, and the main flight parameters (for example, cruise FL, Cost Index). The IRS INIT page enables the alignment of the Inertial Reference System (IRS). The flight crew then uses the INIT B page to insert the aircraft weight, block fuel, Center of Gravity (CG), and other fuel requirements. The FMGS uses this data to compute predictions and other fuel planning parameters. The INIT A page is accessed in pre-flight phase to initialize the flight plan. It can also be accessed in flight. The IRS INIT page is accessed via the “IRS INIT” prompt on the INIT A page. The INIT B page is accessed from the INIT A page, by pressing the “←” or “→” scroll keys. It can only be accessed in the pre-flight phase; pressing the scroll keys in flight will revert to the FUEL PRED page.
DATA	Calls up the data index page. This gives the flight crew access to various reference pages that show aircraft position, aircraft status, runways, waypoints, navaids, routes, and data stored by the flight crew.
F-PLN	Calls up the flight plan A and B pages, which contain a leg-by-leg description of the active primary flight plan. The flight crew can use the slewing keys to review the entire active flight plan. They can make all lateral and vertical revisions to the flight plan through these pages, using the left LSKs for lateral revision and the right keys for vertical revision.
RAD NAV	Calls up the radio navigation page. This page displays the Radio Navaids tuned automatically or manually through the FMGC.
FUEL PRED	Calls up the fuel prediction page. Once the engines are started, this page displays the fuel predicted to be remaining at the destination and the alternate, as well as fuel management data.
SEC F-PLN	Calls up the index page for the secondary flight plan. The flight crew can use this page to call up the secondary flight plan and all the functions related to it (copying, deleting, reviewing, activating, and the INIT and PERF pages).
ATC COMM	Calls up the ATC applications (not activated).

MCDU MENU	Calls up the MCDU MENU page, which displays the subsystems currently addressed via the MCDU. The key next to the name of a subsystem enables the flight crew to select that subsystem. When the MCDU MENU annunciator lights up, the flight crew should press the MCDU MENU key. The menu will have [REQ] displayed next to the name of the subsystem that requires attention.

MCDU DISPLAY

The MCDUs display:
- Position and accuracy information
- Tuned navaids
- Lateral and vertical flight plans (waypoints, pseudo waypoints, constraints)
- Predictions (SPD, TIME, ALT, WIND)
- Fuel predictions and fuel management information (estimated fuel on board, extra fuel)
- Performance data.

Applicable to: ALL

The Flight Control Unit (FCU) is located on the glareshield and is constituted of three control panels: One for the automatic flight controls and two for the Electronic Flight Instrument System (EFIS). The FCU has two channels, each of which can independently command the central control panel. If one channel fails, the other channel can control all the functions.

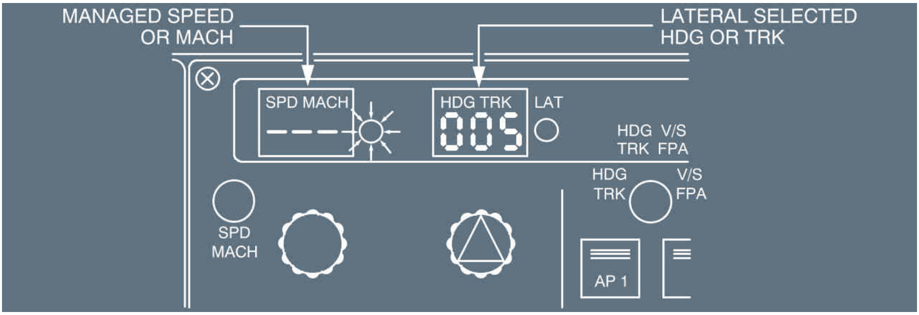
FCU PHILOSOPHY

Ident.: DSC-22_10-40-20-00010113.0002001 / 14 MAY 12
Applicable to: ALL

The flight crew can use two types of guidance to control the aircraft in auto flight. One type is managed by the Flight Management Guidance System (FMGS). The other uses target quantities which are manually entered by the flight crew.
When the aircraft uses target quantities from the FMGS (managed guidance), the FCU windows display dashes and the white dots next to those windows light up. When the aircraft uses target quantities, entered by the flight crew (selected guidance), the windows display the selected numbers and the white dots do not light up.



Note: *The altitude window always displays an altitude selected by the flight crew (never dashes).*

The FCU has four knobs:
- SPD-MACH
- HDG-TRK
- ALT
- V/S-FPA.

The knobs can be rotated, pushed in, and pulled out:
- In order to arm or engage managed guidance for a given mode, the flight crew pushes in the associated knob. If, for example, they push in the HDG knob, they engage or arms the NAV mode.
- In order to engage a selected guidance mode, the flight crew turns the knob to set the desired value, then pulls the knob out to engage the mode with a target value equal to the selected value.

Note: *In managed guidance (lateral, vertical guidance or managed speed), the corresponding window is dashed. Turning a knob without pulling it, displays a value that is the sum of the current target and the turn action value. The display remains 45 s on the HDG/TRK and V/S windows and 10 s on the SPD/MACH window before the dashes reappear. This rule does not apply to the ALT knob/window.*

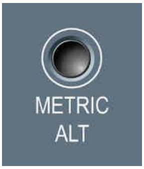
The FCU altitude window always displays a target value selected by the flight crew. It never displays dashes.

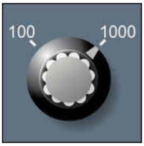
METER SELECTOR - METRIC ALT pb



- Displays the target altitude (either the FCU - selected altitude, or the FMaltitude constraint) and the current altitude in meters on the PFD.

ALTITUDE SELECTOR knob (INNER AND OUTER)

When turned, sets the target altitude in the FCU window.



: Display range: 100 to 49 000 ft
- The outer knob has two positions: 100 and 1000
- The inner knob sets the altitude in the FCU window, in increments of 100 or 1 000 ft , depending upon the position of the outer knob.

V/S or FPA SELECTOR knob

UP
PUSH
TO
LEVEL
OFF
DN

: - Range (V/S) : – 6 000 to + 6 000 ft/min
2 clicks = 100 ft/min
If the flight crew turns the knob slowly, each click equals 100 ft/min.

Range (FPA) : – 9.9 ° to + 9.9 °
1 click = 0.1 °.

The flight crew turns this knob to set the value of V/S or FPA to be displayed in the V/S or FPA window (they choose which, V/S or FPA, is to be displayed by pushing the HDG V/S - TRK FPA pb).

One rotation of the knob corresponds to 32 clicks. One complete rotation sets:
FPA = 3.2 °
V/S = 1 600 ft/min.

When turned, if in V/S or FPA mode, selects a vertical speed or flight path angle target. If not in V/S or FPA mode (V/S / FPA window is dashed), preselects a vertical speed or flight path angle target. When the V/S or FPA mode engages (flight crew action or mode reversion), this preselected value becomes the target.

Note: *If the V/S or FPA mode is not engaged within 45 s after preselection, the preselected value is cancelled and the dashes reappear.*

When the flight crew pushes the V/S or FPA knob, the system commands an immediate level-off by engaging the V/S or FPA mode with a target of zero. When the aircraft V/S or FPA becomes zero, the FMA displays V/S = 0. If the flight crew then turns the knob to set a new value for V/S or FPA, the aircraft changes flight path accordingly.

MODE ENGAGEMENT - EXPED pb

- This pushbutton is used to engage the expedite mode (*Refer to DSC-22_30-80-20 EXP CLB*, *Refer to DSC-22_30-80-20 EXP DES*).

MODE ENGAGEMENT - APPR pb

: When pushed arms, disarms, engages, or disengages the approach modes:
- LOC and G/S modes if an ILS/ GLS / SLS approach is selected in the active F-PLN
- F-LOC and F-G/S modes, if a VOR, VOR/DME, NDB, NDB/DME, or RNAV(GNSS) approach is selected in the active F-PLN, and if FLS guidance is selected in the PERF APPR page
- LOC and F-G/S modes, if a LOC only approach is selected in active F-PLN, and if FLS guidance is selected in the PERF APPR page
- APP NAV-FINAL modes, if a VOR, VOR/DME, NDB, NDB/DME, or RNAV(GNSS) approach is selected in the active F-PLN, and FINAL APP guidance mode is selected in the PERF APPR page.

The FCU altitude window always displays a target value selected by the flight crew. It never displays dashes.

Altitude knob (INNER AND OUTER)

Display range: 100 to 49 000 ft

- The outer knob has two positions: 100 and 1000
- The inner knob sets the altitude in the FCU window in increments of 100 or 1 000 ft, depending upon the position of the outer knob.

EXPED pb

This pushbutton is used to engage the expedite mode (*Refer to DSC-22_30-80-20 EXP CLB*, *Refer to DSC-22_30-80-20 EXP DES*).

METRIC ALT pb

This pushbutton is used to display the FCU altitude target in meters on the ECAM, or the current altitude and FCU/FM altitude target in meters on the PFD .

V/S or FPA knob

Range (V/S) : –6 000 to +6 000 ft/min
2 clicks = 100 ft/min
If the flight crew turns the knob slowly, each click equals 100 ft/min.

Range (FPA) : –9.9 ° to +9.9 °
1 click = 0.1 °

The flight crew turns this knob to set the value of V/S or FPA to be displayed in the V/S or FPA window (they choose which, V/S or FPA, is to be displayed by pushing the HDG V/S - TRK FPA pb).

One rotation of the knob corresponds to 32 clicks. One complete rotation sets:
FPA = 3.2 °
V/S = 1 600 ft/min

When turned, if in V/S or FPA mode, selects a vertical speed or flight path angle target. If not in V/S or FPA mode (V/S / FPA window is dashed), preselects a vertical speed or flight path angle target. When the V/S or FPA mode engages (flight crew action or mode reversion), this preselected value becomes the target.

Note: *If the V/S or FPA mode is not engaged within 45 s after preselection, the preselected value is cancelled and the dashes reappear.*

When the flight crew pushes the V/S or FPA knob, the system commands an immediate level-off by engaging the V/S or FPA mode with a target of zero. When the aircraft V/S or FPA becomes zero, the FMA displays V/S = 0. If the flight crew then turns the knob to set a new value for V/S or FPA, the aircraft changes flight path accordingly.

APPR pb

This pushbutton arms, disarms, engages, or disengages the approach modes:
- LOC and G/S modes, if an ILS approach is selected in the active F-PLN.
- APP NAV-FINAL modes, if a non precision approach is selected in the active F-PLN.

GENERAL

Ident.: DSC-22_10-50-10-00020369.0001001 / 17 MAR 17
Applicable to: ALL

This chapter shows the speed symbols and definitions.
The source of the computation is also given, when applicable.

Intentionally left blank

CHARACTERISTIC SPEEDS

1 Ident.: DSC-22_10-50-20-00020370.0027001 / 03 DEC 19
Applicable to: MSN 11531

The characteristic speeds displayed on the PFD are computed by the Flight Augmentation Computer (FAC), according to the FMS weight data (for PFD/MCDU display consistency and accuracy purposes).
VLS (of normal landing configuration: CONF 3 or FULL), F, S and Green Dot speeds are also displayed on the MCDU TAKEOFF and/or APPR pages.
The speeds displayed by the MCDU are computed by the FMS, based on the aircraft gross weight (which is computed according to the entered ZFW and the FOB), or the predicted gross weight (for approach or go-around).

VS : Stalling speed.
Not displayed.
For a conventional aircraft, the reference stall speed, VSmin, is based on a load factor that is less than 1 g. This gives a stall speed that is lower than the stall speed at 1 g. All operating speeds are expressed as functions of this speed (for example, VREF = 1.3 VSmin).
Because aircraft of the A320 family have a low-speed protection feature (alpha limit) that the flight crew cannot override, Airworthiness Authorities have reconsidered the definition of stall speed for these aircraft.
All the operating speeds must be referenced to a speed that can be demonstrated by flight tests. This speed is designated VS1g.

Airworthiness Authorities have agreed that a factor of 0.94 represents the relationship between VS1g for aircraft of the A320 family and VSmin for conventional aircraft types. As a result, Authorities allow aircraft of the A320 family to use the following factors :

$V2 = 1.2 \times 0.94\ VS1g = 1.13\ VS1g$

$VREF = 1.3 \times 0.94\ VS1g = 1.23\ VS1g$

These speeds are identical to those that the conventional 94 % rule would have defined for these aircraft. The A318, A319, A320 and A321 have exactly the same maneuver margin that a conventional aircraft would have at its reference speeds.
The FCOM uses VS for VS1g.

VLS : Lowest Selectable Speed.
Represented by the top of an amber strip along the airspeed scale on the PFD.
Computed by the FAC, based on FMS, and corresponds to 1.13 VS during takeoff, or following a touch and go.
Becomes 1.23 VS, after retraction of one step of flaps.
Becomes 1.28 VS, when in clean configuration.

Note: *If in CONF 0 VLS were 1.23 VS (instead of 1.28 VS), the alpha protection strip would hit the VLS strip on the PFD.*

Above 20 000 ft, VLS is corrected for Mach effect to maintain a buffet margin of 0.2 g.
In addition, VLS increases when the speedbrakes are extended.
In landing configurations (CONF 3 and FULL) VLS is always equal to, or greater than, VMCL.

F : Minimum speed at which the flaps may be retracted at takeoff.
In approach, used as a target speed when the aircraft is in CONF 2 or CONF 3.
Represented by “F” on the PFD speed scale. Equal to 1.26 VS of CONF 1 + F, and limited to a minimum of 1.1 VMCA and VMCL + 15 kt.

S : Minimum speed at which the slats may be retracted at takeoff.
In approach, used as a target speed when the aircraft is in CONF 1.
Represented by “S” on the PFD airspeed scale.
Equal to 1.23 VS of clean configuration, and limited to a minimum of VMCL + 20 kt.

O : Green dot speed.
Engine-out operating speed in clean configuration.
(Best lift-to-drag ratio speed).
Also corresponds to the final takeoff speed.
Represented by a green dot on the PFD scale.
Below 15 000 ft equal to 1.5 × weight (metric tons) +110

CHARACTERISTIC SPEEDS

Ident.: DSC-22_10-50-20-00020370.0004001 / 03 DEC 19

2 **Applicable to: MSN 08495-09324, 10949-11522, 11572-11597**

The characteristic speeds displayed on the PFD are computed by the Flight Augmentation Computer (FAC), according to the FMS weight data (for PFD/MCDU display consistency and accuracy purposes).
VLS (of normal landing configuration: CONF 3 or FULL), F, S and Green Dot speeds are also displayed on the MCDU TAKEOFF and/or APPR pages.

Applicable to: MSN 05528, 05947-05987, 06097, 06121, 06163-06165

The characteristic speeds displayed on the PFD are computed by the Flight Augmentation Computer (FAC), according to the FMS weight data (for PFD/MCDU display consistency and accuracy purposes), and aerodynamic data as a backup.
VLS (of normal landing configuration: CONF 3 or FULL), F, S, and Green Dot speeds are also displayed on the MCDU TAKEOFF and/or APPR pages.
The speeds displayed by the MCDU are computed by the FMS, based on the aircraft gross weight (which is computed according to the entered ZFW and the FOB), or the predicted gross weight (for approach or go-around).

VS : Stalling speed.
Not displayed.
For a conventional aircraft, the reference stall speed, VSmin, is based on a load factor that is less than 1 g. This gives a stall speed that is lower than the stall speed at 1 g. All operating speeds are expressed as functions of this speed (for example, VREF = 1.3 VSmin).
Because aircraft of the A320 family have a low-speed protection feature (alpha limit) that the flight crew cannot override, Airworthiness Authorities have reconsidered the definition of stall speed for these aircraft.
All the operating speeds must be referenced to a speed that can be demonstrated by flight tests. This speed is designated VS1g.

Airworthiness Authorities have agreed that a factor of 0.94 represents the relationship between VS1g for aircraft of the A320 family and VSmin for conventional aircraft types. As a result, Authorities allow aircraft of the A320 family to use the following factors:

- V2 = 1.2 × 0.94 VS1g = 1.13 VS1g
- VREF = 1.3 × 0.94 VS1g = 1.23 VS1g

These speeds are identical to those that the conventional 94 % rule would have defined for these aircraft. The A318, A319, A320, and A321 have exactly the same maneuver margin that a conventional aircraft would have at its reference speeds.
The FCOM uses VS for VS1g.

VLS : Lowest Selectable Speed.
Represented by the top of an amber strip along the airspeed scale on the PFD.
Computed by the FAC based on FMS weight data, and on aerodynamic data as a backup, and corresponds to 1.13 VS during takeoff or following a touch and go.
Becomes 1.23 VS, after retraction of one step of flaps.
Becomes 1.28 VS, when in clean configuration.

Note: *If in CONF 0 VLS were 1.23 VS (instead of 1.28 VS), the alpha protection strip would hit the VLS strip on the PFD.*

Above 20 000 ft, VLS is corrected for Mach effect to maintain a buffet margin of 0.2 g.
In addition, VLS increases when the speedbrakes are extended.

F : Minimum speed at which the flaps may be retracted at takeoff.
In approach, used as a target speed when the aircraft is in CONF 2 or CONF 3.
Represented by “F” on the PFD speed scale. Equal to about 1.19 VS of CONF 1 + F.

S : Minimum speed at which the slats may be retracted at takeoff.
In approach, used as a target speed when the aircraft is in CONF 1.
Represented by “S” on the PFD airspeed scale.
Equal to about 1.25 VS of clean configuration.

O : Green dot speed.
Engine-out operating speed in clean configuration.
(Best lift-to-drag ratio speed).
Also corresponds to the final takeoff speed.
Represented by a green dot on the PFD scale.
Below 20 000 ft equal to 1.5 × weight (metric tons) +110
Above 20 000 ft, add 1 kt per 1 000 ft

LIMIT SPEEDS

Ident.: DSC-22_10-50-30-00020383.0001001 / 17 MAR 17
Applicable to: ALL

VA	:	Maximum design maneuvering speed. This corresponds to the maximum structural speed permitted for full control deflection, if alternate or direct law is active.
VMCG	:	Minimum speed, on the ground during takeoff, at which the aircraft can be controlled by only using the primary flight controls, after a sudden failure of the critical engine, the other engine remaining at takeoff thrust.
VMCA	:	Minimum control speed in flight at which the aircraft can be controlled with a maximum bank of 5 °, if one engine fails, the other engine remaining at takeoff thrust (takeoff flap setting, gear retracted).
VMCL	:	Minimum control speed in flight, at which the aircraft can be controlled with a maximum bank of 5 °, if one engine fails, the other engine remaining at takeoff thrust (approach flap setting).
VFE	:	Maximum speed for each flap configuration.
VLE	:	Maximum speed with landing gear extended.
VLO	:	Maximum speed for landing gear operation.
VMO	:	Maximum speed.
VFE NEXT	:	Maximum speed for the next (further extended) flap lever position.

Intentionally left blank

PROTECTION SPEEDS

Ident.: DSC-22_10-50-40-00020382.0001001 / 17 MAR 17
Applicable to: ALL

Vα PROT, Vα MAX and VSW are computed by the FAC, based on aerodynamic data. They are only used for display on the PFD, and not for flight control protection (the activation of the protections is computed by the ELAC).

Vα PROT	:	Angle of attack protection speed. Corresponds to the angle of attack at which the angle of attack protection becomes active. Represented by the top of a black and amber strip along the PFD speed scale, in normal law.
Vα MAX	:	Maximum angle of attack speed. Corresponds to the maximum angle of attack that may be reached in pitch normal law. Represented by the top of a red strip along the PFD speed scale, in normal law.
VSW	:	Stall warning speed. Represented by a red and black strip along the speed scale when the flight control normal law is inoperative.
VMAX	:	Represented by the bottom of a red and black strip along the speed scale. Determined by the FAC according to the aircraft configuration. Is equal to VMO (or speed corresponding to MMO), VLE or VFE.

Intentionally left blank

V1	:	The highest speed, during takeoff, at which the flight crew has a choice between continuing the takeoff or stopping the aircraft. Represented by “1” on the airspeed scale (or the V1 value when it is off the airspeed scale). Inserted manually through the MCDU by the flight crew. Displayed on the MCDU TAKEOFF page.
VR	:	The speed at which the pilot rotates in order to reach V2 at an altitude of 35 ft at the latest after an engine failure. Inserted manually through the MCDU by the flight crew. Displayed on the MCDU TAKEOFF page.
V2	:	Takeoff safety speed that the aircraft attains at the latest at an altitude of 35 ft with one engine failed, and maintains during the second segment of the takeoff. Represented by the SPEED SELECT symbol on the speed scale. Minimum value equal to 1.13 VS for the corresponding configuration. Inserted manually through the MCDU by the flight crew. Displayed on the MCDU TAKEOFF page.
VREF	:	Reference speed used for normal final approach. Equal to 1.23 × VS of CONF FULL. Displayed on the MCDU APPR page, if landing is planned in CONF FULL (VLS CONF FULL).
VAPP	:	Final approach speed. Displayed on MCDU APPR page. Calculated by the FMGCs. Represents : VAPP = VLS + wind correction The wind correction is limited to a minimum of 5 kt and a maximum of 15 kt. The flight crew may modify VAPP through the MCDU. - During autoland or when A/THR is on or in case of ice accretion or gusty crosswind greater than 20 kt, VAPP must not be lower than VLS +5 kt.

V1 : The highest speed, during takeoff, at which the flight crew has a choice between continuing the takeoff or stopping the aircraft.
Represented by “1” on the airspeed scale (or the V1 value when it is off the airspeed scale).
Inserted manually through the MCDU by the flight crew.
Displayed on the MCDU TAKEOFF page.

VR : The speed at which the pilot rotates in order to reach V2 at an altitude of 35 ft at the latest after an engine failure.
Inserted manually through the MCDU by the flight crew.
Displayed on the MCDU TAKEOFF page.

V2 : Takeoff safety speed that the aircraft attains at the latest at an altitude of 35 ft with one engine failed, and maintains during the second segment of the takeoff.
Represented by the SPEED SELECT symbol on the speed scale.
Minimum value equal to 1.13 VS for the corresponding configuration.
Inserted manually through the MCDU by the flight crew.
Displayed on the MCDU TAKEOFF page.

VREF : Reference speed used for normal final approach.
Equal to 1.23 x VS of CONF FULL.
Displayed on the MCDU APPR page, if landing is planned in CONF FULL (VLS CONF FULL).

VAPP : Final approach speed.
Displayed on MCDU APPR page.
Calculated by the FMGCs.
Represents : VAPP = VLS + wind correction.
The wind correction is limited to a minimum of 5 kt and a maximum of 15 kt.
The flight crew may modify VAPP through the MCDU.

- During autoland or when A/THR is on or in case of ice accretion or gusty crosswind greater than 20 kt, VAPP must not be lower than VLS +5 kt.
- For landing in configuration 3 with ice accretion VAPP must not be lower than VLS +10 kt.

OTHER SPEEDS

GENERAL

Ident.: DSC-22_20-10-00010128.0001001 / 17 AUG 10
Applicable to: ALL

The flight management and guidance system (FMGS) performs navigation functions and lateral and vertical flight planning functions. It also computes performance parameters and guides the aircraft along a preplanned route.

The Flight Management (FM) part controls the following functions:
- Navigation
- Management of flight planning
- Prediction and optimization of performance
- Management of navigation radios
- Management of displays

Intentionally left blank

NAVIGATION

Ident.: DSC-22_20-20-05-00010129.0001001 / 17 AUG 10
Applicable to: ALL

Essential navigation functions are:
- Computation of position
- Evaluation of position accuracy
- Radio navigation tuning
- Alignment of Inertial Reference System.

Intentionally left blank

GENERAL

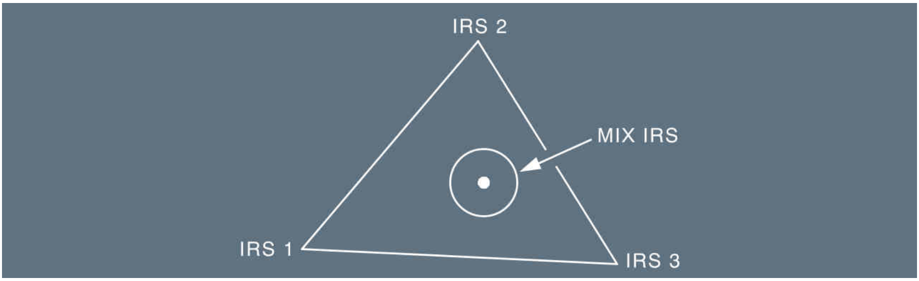
Ident.: DSC-22_20-20-10-00010130.0002001 / 16 MAR 11
Applicable to: ALL

Each FMGC computes its own aircraft position (called the "FM position") from a MIX IRS position and a computed radio position, or a GPS position.
The FMGS selects the most accurate position, considering the estimated accuracy and integrity of each positioning equipment.
GPS/INERTIAL is the basic navigation mode, provided GPS data is valid and successfully tested. Otherwise, navaids plus inertial or inertial only are used. (*Refer to DSC-22_20-20-10 Navigation Modes*).

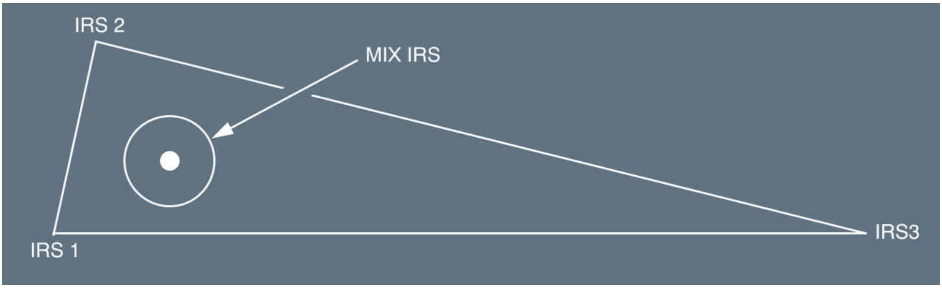
MIX IRS POSITION

Ident.: DSC-22_20-20-10-00010131.0002001 / 03 NOV 22
Applicable to: ALL

Each FMGC receives a position from each of the three IRS, and computes a mean-weighted average called the “MIX IRS” position:



- If one of the IRS drifts abnormally, the MIX IRS position uses an algorithm that decreases the influence of the drifting IRS within the MIX IRS position



- If one of the IRS fails, each FMGC uses only one IRS (onside IRS or IRS3). Each IRS position and inertial speed are continuously tested. If the test fails, the corresponding IRS is rejected.
- When each IRS position is compared to the FM position, and the difference is more than a threshold function of time, the CHECK IRS 1(2)(3)/FM POSITION message is displayed on the MCDU.

GPS POSITION

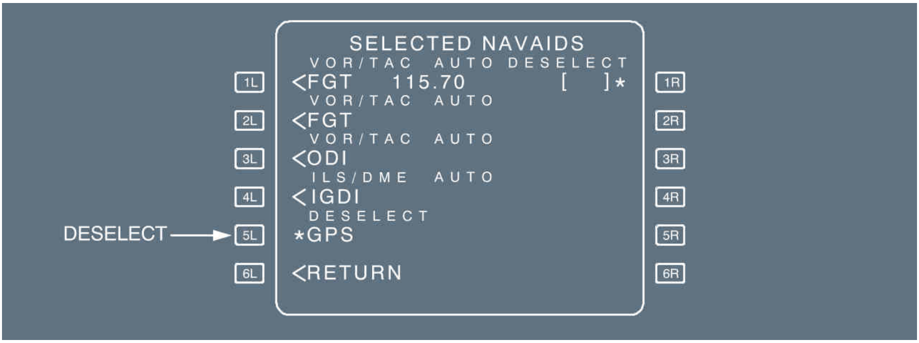
Ident.: DSC-22_20-20-10-00010132.0002001 / 23 JUN 15

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

Each IRS computes a mixed IRS/GPS position called the GPIRS position. For this, each IRS can independently select their GPS source in order to maximize the availability of GPS data.
Of the three GPIRS positions that each FMGC receives, the FMS selects one GPIRS position based on a figure of merit and priority.

The FMS uses the following hierarchy to perform the selection:
- Onside GPIRS position
- GPIRS 3
- Opposite GPIRS position.

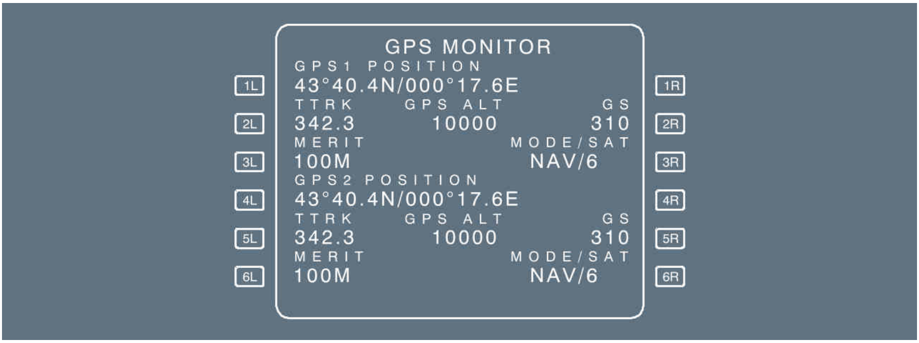
If the GPIRS data does not comply with an integrity criterion that is based on a Horizontal Integrity Limit (HIL) and on the automatic detection of failed satellites, the FMS rejects the GPS mode and uses the radio position update.
The flight crew can deselect/select the GPS position on the SELECTED NAVAIDS page, if necessary.



```
        SELECTED NAVAIDS
  VOR/TAC    AUTO DESELECT
<FGT    115.70        [   ]*
  VOR/TAC    AUTO
<FGT
  VOR/TAC    AUTO
<ODI
  ILS/DME    AUTO
<IGDI
  DESELECT
*GPS

<RETURN
```

Information about the GPS position is displayed on the GPS MONITOR page.



```
            GPS MONITOR
GPS1  POSITION
43°40.4N/000°17.6E
TTRK       GPS ALT          GS
342.3       10000          310
MERIT                 MODE/SAT
100M                     NAV/6
GPS2 POSITION
43°40.4N/000°17.6E
TTRK       GPS ALT          GS

MERIT                 MODE/SAT
100M                     NAV/6
```

Note: *In nominal case, ADIRU1 selects GPS1 and ADIRU2 selects GPS2. The GPS selection by ADIRU3 depends on the position of the ATT HDG selector switch. If one of the GPS source is rejected by the ADIRUs, all ADIRUs will select the same GPS source. As a result, the data of the GPS that is not selected is dashed on the GPS MONITOR page. The "GPS PRIMARY LOST" message may not be displayed.*

GPS POSITION

Ident.: DSC-22_20-20-10-00010132.0015001 / 23 JUN 15
Applicable to: MSN 04827-04860

Each IRS computes a mixed IRS/GPS position called the GPIRS position. For this, each IRS can independently select their GPS source in order to maximize the availability of GPS data.
Of the three GPIRS positions that each FMGC receives, the FMS selects one GPIRS position based on a figure of merit and priority.

The FMS uses the following hierarchy to perform the selection:
- Onside GPIRS position
- GPIRS 3
- Opposite GPIRS position.

If the GPIRS data does not comply with an integrity criterion that is based on a Horizontal Integrity Limit (HIL) and on the automatic detection of failed satellites, the FMS rejects the GPS mode and uses the radio position update.
The flight crew can deselect/select the GPS position on the SELECTED NAVAIDS page, if necessary.

100M      32000     NAV/6
```

Note: *In nominal case, ADIRU1 selects GPS1 and ADIRU2 selects GPS2. The GPS selection by ADIRU3 depends on the position of the ATT HDG selector switch. If one of the GPS source is rejected by the ADIRUs, all ADIRUs will select the same GPS source. As a result, the data of the GPS that is not selected is dashed on the GPS MONITOR page. The "GPS PRIMARY LOST" message may not be displayed.*

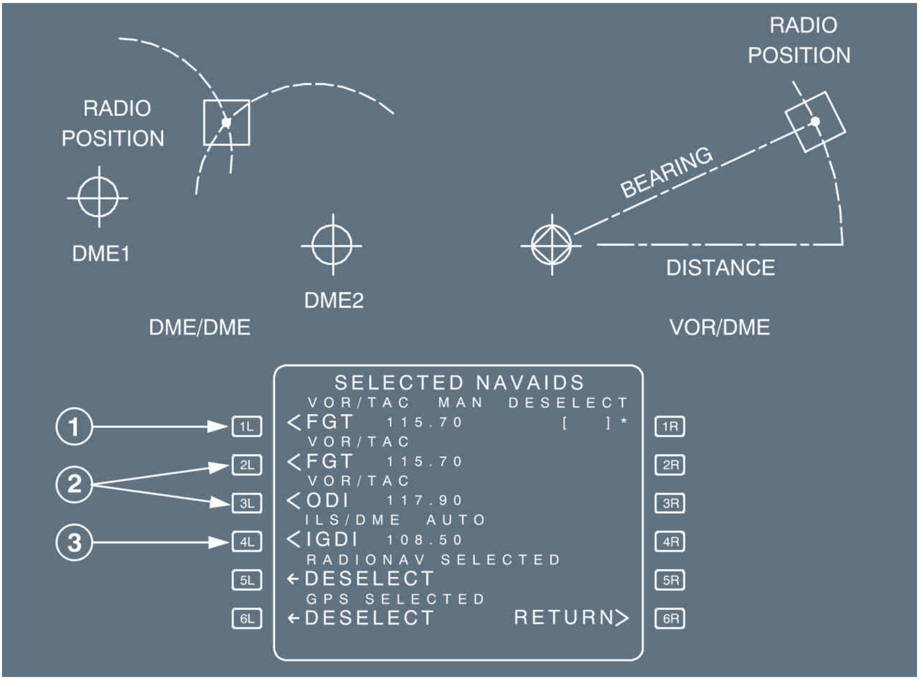
RADIO POSITION

Ident.: DSC-22_20-20-10-00010669.0020001 / 01 OCT 12
Applicable to: ALL

Each FMGC uses onside navaids to compute its own radio position. These navaids are displayed on the SELECTED NAVAIDS page.

The available navaids are:
- DME/DME
- VOR/DME
- LOC
- DME/DME-LOC
- VOR/DME-LOC.

It uses LOC to update the lateral position, using LOC beam during ILS approach.
LOC is also used for quick update, when in GPS/IRS mode.
If one or more navaids fail, each FMGC can use offside navaids to compute the VOR/DME, or the DME/DME radio position.
The radio navaid selection is displayed on the DATA "SELECTED NAVAIDS" page.



```
       SELECTED NAVAIDS
  VOR/TAC    MAN  DESELECT
<FGT    115.70      [   ]*
  VOR/TAC
<FGT    115.70

<ODI    117.90
 ILS/DME   AUTO
<IGDI   108.50
 RADIONAV SELECTED
←DESELECT
 GPS SELECTED
←DESELECT           RETURN>
```

(1) VOR/DME selection (auto or manual) for display (onside VOR).

(2) DMEs automatic selection for DME/DME onside radio position.

(3) ILS selection (auto or manual) for LOC update computation.

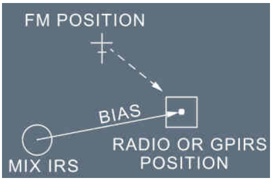
FM POSITION

Ident.: DSC-22_20-20-10-00010135.0017001 / 17 AUG 10
Applicable to: ALL

At flight initialization, each FMGC displays an FM position that is a MIX IRS/GPS position (GPIRS):

- At takeoff, when the FM position is updated to the runway threshold position as stored in the database, possibly corrected by the takeoff shift entered on PERF TO page.
- In flight, the FM position approaches the radio position or the GPS position at a rate depending upon the aircraft altitude.

Note: *The FM position update at takeoff is inhibited when GPS PRIMARY is active.*



BIAS

Each FMGC computes a vector from its MIX IRS position to the radio position or GPIRS position. This vector is called the “bias”.
Each FMGC updates its bias continuously as long as a radio position or a GPIRS position is available.
If an FMGC loses its radio/GPIRS position, it memorizes the bias and uses it to compute the FM position, which equals the MIX IRS position plus the bias. Until the radio or the GPIRS position is restored, the bias does not change.
The flight crew can update the FM position manually. This also updates the bias.

POSITION MONITOR

Ident.: DSC-22_20-20-10-00010136.0016001 / 07 MAY 13
